TABLES

TABLES	DESCRIPTION	PAGE
	AGES.	
1	Persons, males and females, at each census from 1861 to 1946 classified according to age groups.	2
2	Persons, males and females, in the Provinces, at each of the three censuses 1926, 1936 and 1946, classified according to age groups.	3
3A	Persons, males and females, in certain age groups expressed per 10,000 of the total persons, males and females respectively, at each census from 1861 to 1946 (calculated from Table I).	4
3B	Persons, males and females, in certain age groups in the province of Leinster expressed per 10,000 of the total persons, males and females respectively, at each census from 1861 to 1946.	5
3C	Persons, males and females, in certain age groups in the province of Munster expressed per 10,000 of the total persons, males and females respectively, at each census from 1861 to 1946.	6
3D	Persons, males and females, in certain age groups in the province of Connacht expressed per 10,000 of the total persons, males and females respectively, at each census from 1861 to 1946.	7
3E	Persons, males and females, in certain age groups in the province of Ulster (part of) expressed per 10,000 of the total persons, males and females respectively, at each census from 1861 to 1946.	8
4	Increase or decrease per cent. in population, according to certain specified age groups, of each province as constituted at each census from 1861 to 1946.	9
5A	Showing for each county and county borough in 1946, males and females by certain age groups, with comparative figures for 1936.	10
5B	Showing for aggregate town areas in each county in 1946, males and females by certain age groups.	14
5C	Showing for aggregate rural areas in each county in 1946, males and females by certain age groups.	16
6A	Showing for each county and county borough in 1946 the proportion per 10,000 of each sex in each age group with comparative figures for 1936.	18

TABLES	DESCRIPTION	PAGE
6B	Showing for aggregate town areas in each county in 1946 the proportion per 10,000 of each sex in each age group.	22
6C	Showing for aggregate rural areas in each county in 1946 the proportion per 10,000 of each sex in each age group.	24
7	Males and females in certain age groups expressed as percentages of the total males and females respectively in each town of 1,500 or more inhabitants and smaller towns possessing local government.	26
8	Males and females in certain age groups expressed as percentages of the total males and females respectively in each rural district (exclusive of towns of 1,500 or more inhabitants and smaller towns possessing local government).	28
ORPHANHOOD AND CONJUGAL CONDITIONS.		
9A	Males 15 years and over at each census from 1881 to 1946 classified according to age groups and conjugal condition—actual numbers and percentages.	32
9B	Females 15 years and over at each census from 1881 to 1946 classified according to age groups and conjugal condition—actual numbers and percentages.	34
10A	Single males and females in each age group expressed as percentages of the total (married, widowed and single) males and females respectively for that age group in each county in each of the years 1911, 1926, 1936 and 1946.	36
10B	Single males and females in each age group in 1946 expressed as percentages of the total (married, widowed and single) males and females respectively for that age group in the aggregate town areas in each county.	44
10C	Single males and females in each age group in 1946 expressed as percentages of the total (married, widowed and single) males and females respectively for that age group in the aggregate rural areas in each county.	46
11	Single males and females in each age group expressed as percentages of total males and females respectively for that age group in each town of 1,500 or more inhabitants and smaller towns possessing local government.	48
12	Single males and females in each age group expressed as percentages of total males and females respectively for that age group in each rural district (excluding towns of 1,500 or more inhabitants and smaller towns possessing local government).	50
13A	Males and females classified by individual ages, orphanhood (under 15 years of age) and conjugal condition (15 years of age and over).	54
13B	Males and females in the aggregate town areas classified by individual ages, orphanhood (under 15 years of age) and conjugal condition (15 years of age and over).	56
13C	Males and females in the aggregate rural areas classified by individual ages, orphanhood (under 15 years of age) and conjugal condition (15 years of age and over).	58
14	Males and females under 15 years of age in each province, county and county borough and in the aggregate town areas and rural areas of each province and county according to orphanhood condition at each year of age.	60
15	Males and females in each county and county borough according to each year of age from 15 years to 24 years inclusive.	94

CONTENTS—(continued).

CENSUS OF POPULATION, 1946.

VOLUME V—PART I.

EXPLANATORY NOTES.

The present volume treats of the classification of the population by ages and gives information regarding the age distribution of the population in the different areas of the country. In later volumes will be presented particulars of the persons in each age group classified according to occupation, industry, religion, birthplace, etc.

Classification by ages is of the utmost importance and the provision of age particulars in the most accurate form obtainable is a matter to which great attention is given at Census inquiries. At the Censuses of 1926 and 1936 the householder was asked to state the age of each person in the household in years and months. Prior to the inquiry of 1926 it had been the practice to obtain statistics of age from a statement on the Census Schedule of the number of completed years of age at Census date. For the Census of Population, 1946, particulars of date of birth of each person were requested and the summarization of these particulars gives results of a more accurate nature than were available heretofore.

The tendency, evident at previous Censuses, of furnishing ages which grouped at 30, 40, 50, etc., and in a lesser way at 25, 35, etc., has to a large extent been counteracted by the introduction of date of birth as a means of recording age. The following figures, showing the number of males in 1926, 1936 and 1946, respectively recorded at particular ages, reflects a considerable improvement.

Age			1926		1936		1946
29	...	...	18,001	...	19,893	...	21,268
30	...	...	26,271	...	22,324	...	20,501
31	...	...	14,666	...	16,598	...	21,168
39	...	...	14,550	...	17,728	...	19,469
40	...	...	28,589	...	22,490	...	18,124
41	...	...	11,702	...	14,699	...	16,875
49	...	...	13,838	...	14,695	...	17,608
50	...	...	31,170	...	21,168	...	16,309
51	...	...	11,135	...	12,650	...	14,308
59	...	...	9,641	...	13,688	...	14,386
60	...	...	20,141	...	18,370	...	12,818
61	...	...	6,720	...	10,987	...	11,956

Where particulars of age were not entered on the Schedules separate consideration was given to each case and an age was assumed which was based on the other information shown on the schedule. Such cases were relatively few.

MARRIAGE OR ORPHANHOOD.

For children under 15 years information was sought regarding the parents: whether both parents were alive, father dead, mother dead, or both parents dead. In an appreciable number of cases this information was not available or not given and consequently the tables published show a column for "orphanhood not stated,"

CONJUGAL CONDITION.

Information regarding conjugal condition was sought in respect of persons 15 years of age and over, *i.e.*, whether single, married, widower or widow. In addition to the actual figures for these categories the tables in this volume show the number of single persons in each age group expressed as a percentage of the total in that age group.

FERTILITY OF MARRIAGE.

For each married woman information as to the number of children born to the existing marriage was collected and will be published in a volume relating to Fertility of Marriage. For married men, widowers and widows particulars of the number of dependent children under 16 years of age were compiled and will be shown in a report dealing with Dependency.

LIFE TABLE.

The Life Tables based upon Census of Population figures classified by ages and on statistics of deaths published by the Registrar-General, are included as Tables 21 and 22. They are accompanied by a memorandum explaining the method of computation.

AGE LAST BIRTHDAY.

In setting out the tables in this report the ages shown in all cases represent the age last birthday, *e.g.*, in Table 15 persons shown as in the age group 15-19 have reached their fifteenth birthday but are under 20 years of age.

TABLES.

TABLE I:—TOTAL PERSONS, MALES AND FEMALES IN IRELAND (EXCLUSIVE OF THE SIX COUNTIES) AT EACH OF THE NINE CENSUSES FROM 1861 TO 1946 CLASSIFIED ACCORDING TO AGE GROUPS.

(a) The boundaries of Dublin City were extended under the Local Government (Dublin) (Amendment) Act, 1940, and again under the Local Government (Dublin) (Amendment) Act, 1944. The figures for Dublin City and County are grouped in the above Table in order to furnish a comparative basis for the revised Area.

COUNTY BOROUGH IN IRELAND (EXCLUSIVE OF THE SIX COUNTIES) IN 1946 WITH FIGURES FOR 1936.

(a) Under Order of Minister for Local Government dated 6/10/44 an area was transferred from the Dispensary District of Rathfarnham to the Dispensary District of South City, but no Order making corresponding changes in the Registrars' Districts in the affected areas has yet been made; consequently, the population of Rathfarnham Dispensary District is less than, and that of South City Dispensary District is greater than, the total population of the constituent Registrars' Districts by the population figure for the area thus transferred. (See footnote to Table 10 on page 30 of Vol. I).

TABLE 21 :—IRISH LIFE TABLE No. 4, 1945-47—MALES.

(For explanation of calculation see Memorandum on p. 249).

KEY TO THE NOTATION.

q_x = The rate of mortality or the probability of dying in a year. It is the ratio of the number of deaths in the year of age x to $x+1$ to the number entering on the year.

p_x = the probability of living a year, or the ratio of the number completing the year of age x to $x+1$ to the number entering on the year.

l_x = the number according to the life table surviving to exact age x .

d_x = the deaths in the year of age x to $x+1$ among l_x persons who enter on that year.

L_x = the population according to the life table, or the years of life lived, in the year of age x to $x+1$.

T_x = the population, or the years of life lived, above the moment of age x .

e_x = the complete expectation of life in years, or the total future life time which on the average will be passed through by persons aged exactly x .

The following relations hold between these quantities:—

$$p_x = 1 - q_x; l_x - l_{x+1} = d_x; L_x = \frac{1}{2}(l_x + l_{x+1}) \quad (x > 0); T_x = \sum_{y \geq x} L_y; e_x = T_x / l_x$$

Age x	l_x	d_x	p_x	q_x	L_x	T_x	e_x	Age x

MEMORANDUM ON THE CONSTRUCTION OF LIFE TABLES Nos. 4 AND 4A, 1945-47.

DATA USED IN THE CONSTRUCTION OF THE LIFE TABLES.

Life tables appertaining to two areas were prepared, these areas being Ireland (exclusive of the Six Counties) and the aggregate of the four County Boroughs, Dun Laoghaire Borough and the Urban Districts of the State.

For ages 5 years and over the construction of the life tables was based on the Census Population, 12th May, 1946, and the number of deaths in 1945, 1946 and 1947, obtained from the statistics collected by the Registrar-General. For the infantile ages the Registrar-General's statistics of births and deaths were used because the numbers of children at the very young ages are somewhat understated at the Census. The population in each age-group was not adjusted to the middle of the Census year, as is usually the practice in other countries, because in Ireland there is no reason to believe that the population on 30th June, 1946, is closer than the population on Census date to the average population of the three years 1945-47. The grouped population data utilised in the life tables for Ireland (exclusive of the Six Counties) are given in Table 16, and in respect of Urban Districts grouped population data were extracted from basic tables used in the compilation of Table 18 of this Volume. The Registrar-General's statistics of births and deaths in Ireland are appended. The corresponding statistics relating to Urban Districts are not published by the Registrar-General.

METHOD OF COMPUTATION.

Previous Irish Life Tables were computed by a method closely following that first used by Mr. George King* in the construction of English life tables. This method applied to Irish data involved the calculation of graduated pivotal values of the population and annual average deaths at certain ages, every fifth year being chosen from age 17 to 32 and every tenth year from age 40 to 80, the use of these decennial intervals being considered necessary on account of the misstatement of age at death after middle-age. Apart from the undesirability of changing from quinquennial to decennial intervals, the comparison of actual and expected deaths was unsatisfactory in the older age-groups. When this method of construction was applied to the 1946 data the comparison of actual and expected deaths was less satisfactory than on the previous occasions, and accordingly it was felt that a life table constructed in this manner was not a true reflection of mortality in the State. A number of different methods of construction were tested and the method described in the following paragraphs was finally adopted as being the best.

It was decided that accurate quinquennial pivotal values were preferable to the use of decennial pivotals, but preliminary computation had shown that there was a marked overstatement of deaths in the age-groups ending with the digits 0 to 4 and a marked understatement in the other age-groups at ages above 45 years. It was, therefore, considered essential to redistribute the deaths into 5-year age-groups, keeping the number of deaths in the age-groups 45-54, 55-64, etc., constant. To do this the number of expected deaths in the 1946 population in each quinquennial age-group above 45 years was calculated by using the 1941 life tables. The actual number of deaths in the group 45-54 years was divided *pro rata* with the expected numbers obtained in the groups 45-49 and 50-54 years, and the resulting figures were used for the numbers of deaths at ages 45-49 and 50-54 years. The numbers of deaths in the other quinquennial age-groups were found in a similar manner.

The population in the Urban Districts was available only in decennial groups at the later ages and it was necessary to divide these into quinquennial groups. This was effected by dividing each decennial group *pro rata* with the numbers of males or females in the Town Areas in the corresponding quinquennial groups. Use was also made of the Town Areas' population in conjunction with the 1941 Urban Life Table to effect the redistribution of the Urban deaths into quinquennial groups.

Graduated pivotal values of the population and deaths at quinquennial intervals from age 12 to age 97 years were then calculated, using King's formula $V_x = 0.216W_x - 0.008(W_{x-5} + W_{x+5})$. From these values pivotal values of m_x and hence q_x were computed. After examination the pivotal values of q_x for $x=97$ were rejected in the case of the life tables for the State and values of q_x for $x=87, 92$ and 97 were rejected in the Urban Life Table. The series of pivotal values was completed by calculating q_7 from mortality and population data in the age-groups 2-4, 5-9 and 10-14 years.

* Supplement to the 75th Annual Report of the Registrar-General of Births, Deaths and Marriages in England and Wales, pt. I, Life Tables (Col. 7512/1914).

Osculatory interpolation was used to calculate the values of q_x from $x=12$ to 87 in the life table for the State and from $x=12$ to 77 in the Urban life table. The function $\log(q_x+0.1)$ was used in the interpolation and the method was that adopted by King. To extend the values of q_x beyond these ages a second degree curve was fitted to the last three pivotal values of q_x retained. It was found that such a curve gave the most reasonable values of q_x at the old ages.

The values of q_x from $x=0$ to 4 were derived solely from the deaths in the three years 1945, 1946 and 1947 and from the births registered in each quarter from 1940 to 1947 in the case of the life table for the State and from the births registered in each year in the case of the Urban life table. In these calculations the formula devised by Sir Alfred Watson* for English Life Table No. 9 was used.

The remaining values of q_x from $x=5$ to $x=11$ were obtained by Langrangean interpolation through the points $x=3, 4, 7, 12$ and 13.

Although seven decimal places were retained in the calculation of all q_x 's, the values of q_x were subsequently rounded off to five decimal places and these values used in the computation of the remaining columns of the life tables. In computing the l_x and d_x columns each d_x was rounded off to a whole number before subtracting from the corresponding $\bar{l}_x$ to obtain l_x+1 . The tables were ended at the value $x=105$. Values of L_x (except L_0) were obtained from the relation $L_x = \frac{1}{2}(l_x + l_{x+1})$. L_0 was found by adding to L_1 the number of years of life lived by those who died before reaching age 1, which number was based on the deaths at ages under 1 month, 1-2 months, 2-3 months, 3-6 months and 6-12 months. Values of T_x were obtained by accumulating the values of L_x from the oldest age in the table down to age 0. Values of e_x were obtained directly from the published l_x and T_x columns except at the old ages where the number of deaths each year was below 1,000. At these ages, in order to keep the function e_x of smooth graduation right to the end of the table, four significant figures or four decimal places (whichever amounted to the lesser number of figures) were retained in each d_x and the l_x , L_x and T_x columns were computed accordingly. The values of e_x obtained by this method were inserted in the published tables.

THE ACTUAL-EXPECTED TEST.

In order to show that life tables accurately reflect mortality conditions it is customary to compare in each age-group the actual number of deaths with the "expected" number of deaths which represents the group sum product of the Census population and the life table death-rate at each year of life. At the later ages this test can be applied only to decennial groups on account of the misstatement of age and the redistribution of the deaths into quinquennial age-groups. In the following table the actual and expected numbers of deaths in Ireland are compared for ages 5 and over.

AGES	MALES			FEMALES		
	Deaths 1945-47 Annual Average		Deviation : Expected less Actual	Deaths 1945-47 Annual Average		Deviation : Expected less Actual
	Actual	Expected		Actual	Expected	
5-9 ...	184	178	- 6	171	170	- 1
10-14 ...	148	154	+ 6	145	145	0
15-19 ...	292	288	- 4	310	307	- 3
20-24 ...	380	379	- 1	421	418	- 3
25-29 ...	360	360	0	401	403	+ 2
30-34 ...	373	375	+ 2	417	416	- 1
35-39 ...	425	424	- 1	425	428	+ 3
40-44 ...	488	488	0	465	461	- 4
45-54 ...	1,539	1,532	- 7	1,349	1,346	- 3
55-64 ...	2,844	2,847	+ 3	2,844	2,854	+10
65-74 ...	5,847	5,859	+12	4,858	4,868	+10
75-84 ...	5,233	5,192	-41	4,929	4,883	-46
85-94 ...	1,189	1,190	+ 1	1,421	1,414	- 7
95+ ...	78	130	+52	113	144	+31
TOTAL 5 Years and over	19,380	19,396	+16	17,769	17,757	-12

* The Registrar-General's Decennial Supplement, England and Wales, 1921. Part I.

It will be observed that at all ages except those over 95 years the correspondence is very satisfactory and that the accumulated deviations for all ages are very small. To some extent this satisfactory correspondence was obtained at the expense of smoothness in the rates of mortality at the later ages, where the third and fourth differences of q_x are somewhat large. It was thought preferable, however, to adhere to a good expected test rather than to extreme smoothness in the values of q_x .

THE RESULTS.

In the life table for the State q_x declines from birth to age 11 for males and to age 10 for females. Thereafter it increases constantly with age for males but in the case of females there is a slight recession from age 24 to 26. The mortality rates for females are higher than those for males at ages 4-6 and 12-41 inclusive but at all other ages they are lower.

In the Urban life table q_x declines from birth to age 9 for both sexes. Thereafter it increases constantly with age for males but in the case of females there is a slight recession from age 28 to 30. The mortality rates for females are higher than those for males at ages 13-32. At all other ages the female rates are lower.

The mortality of males is lower in the Urban Districts than in the State at ages 8-10 and 76-83, but at all other ages the rates in the Urban life tables are higher.

Females have a lower mortality rate in the Urban Districts at ages 6-9, 20-34 and 75-86 but at all other ages the Urban rates are higher.

The mortality rates and expectations of life at ages 0, 10, etc., to 80 in 1925-27, 1935-37, 1940-42 and 1945-47 are compared in the following tables:—

The marked decline in the mortality rate at the younger ages (except age 0) since 1925-27 will be noted. The increases recorded at the older ages are probably due to an improvement in statement of age at death. Between 1940-42 and 1945-47 there was an improvement in the expectation of life at all ages up to 41 for males and up to 62 for females in the State as a whole. An improvement was recorded in the Urban Districts at all ages for both males and females.
