REPORT OF AN tÁRD-CHLÁRAITHEOIR FOR THE YEAR 1950.

Do'n Aire Sláinte.

Tá sé d'onóir agam a chur faoi do bhráid Tuarascáil ar Beireatasáí, Básanna agus Pósanna cláraithe sa bhliain, 1950.

P. Ó CINNÉIDE,

Ard-Chláraitheoir.

The term Ireland in this Report excludes the Six Counties.

In this Report births have been assigned to the district containing the normal residence of the parents and deaths to the district containing the normal residence of the deceased. The number of births shown for each of the years 1943 to 1950 is exclusive of late registrations and the number of deaths for each of the years 1940 to 1950 is exclusive of non-residents.

GENERAL SUMMARY

Marriages :—There were 16,018 marriages registered during the year 1950 compared with 16,009 in 1949. The marriage rate per 1,000 population was 5·4. This rate has been comparatively stable since 1947. It is, however, abnormally low when comparison is made with other countries. The average annual marriage rate in 1940–49 was 5·6 per 1,000 population.

Births :—The number of births registered during 1950 was 63,565 and the birth rate was 21·4 per 1,000 population. There has been a small decline in birth rate each year since 1947. The average annual rate for 1940–49 was 21·7 per 1,000 population.

The number of illegitimate births registered was 1,627 which is 2·6 per cent. of all births. This proportion is considerably lower than that of 3·6 per cent. for the years 1940–49.

Deaths :—The number of deaths registered during 1950 was 37,741 and the death rate was 12·7 per 1,000 population. This rate is 0·6 above that for 1948 which, however, was the lowest rate recorded up to that year. The average annual rate for the period 1940–49 was 14·1 per 1,000 population.

Of the deaths registered in 1950, 27·7 per cent. were stated to be due to heart disease, 10·8 to malignant neoplasms, 7·1 to vascular lesions affecting the central nervous system and 6·3 to tuberculosis (all forms).

The number of deaths from tuberculosis was 2,380 and the rate was 0·80 per 1,000 population. This is the lowest rate recorded up to 1950. There has been a considerable decline in this rate since 1947 when the rate was 1·25 per 1,000 population.

There were 4,099 deaths from cancer in 1950. The upward tendency in the number of deaths from this disease has continued. The death rate in 1950 was 1·38 per 1,000 population.

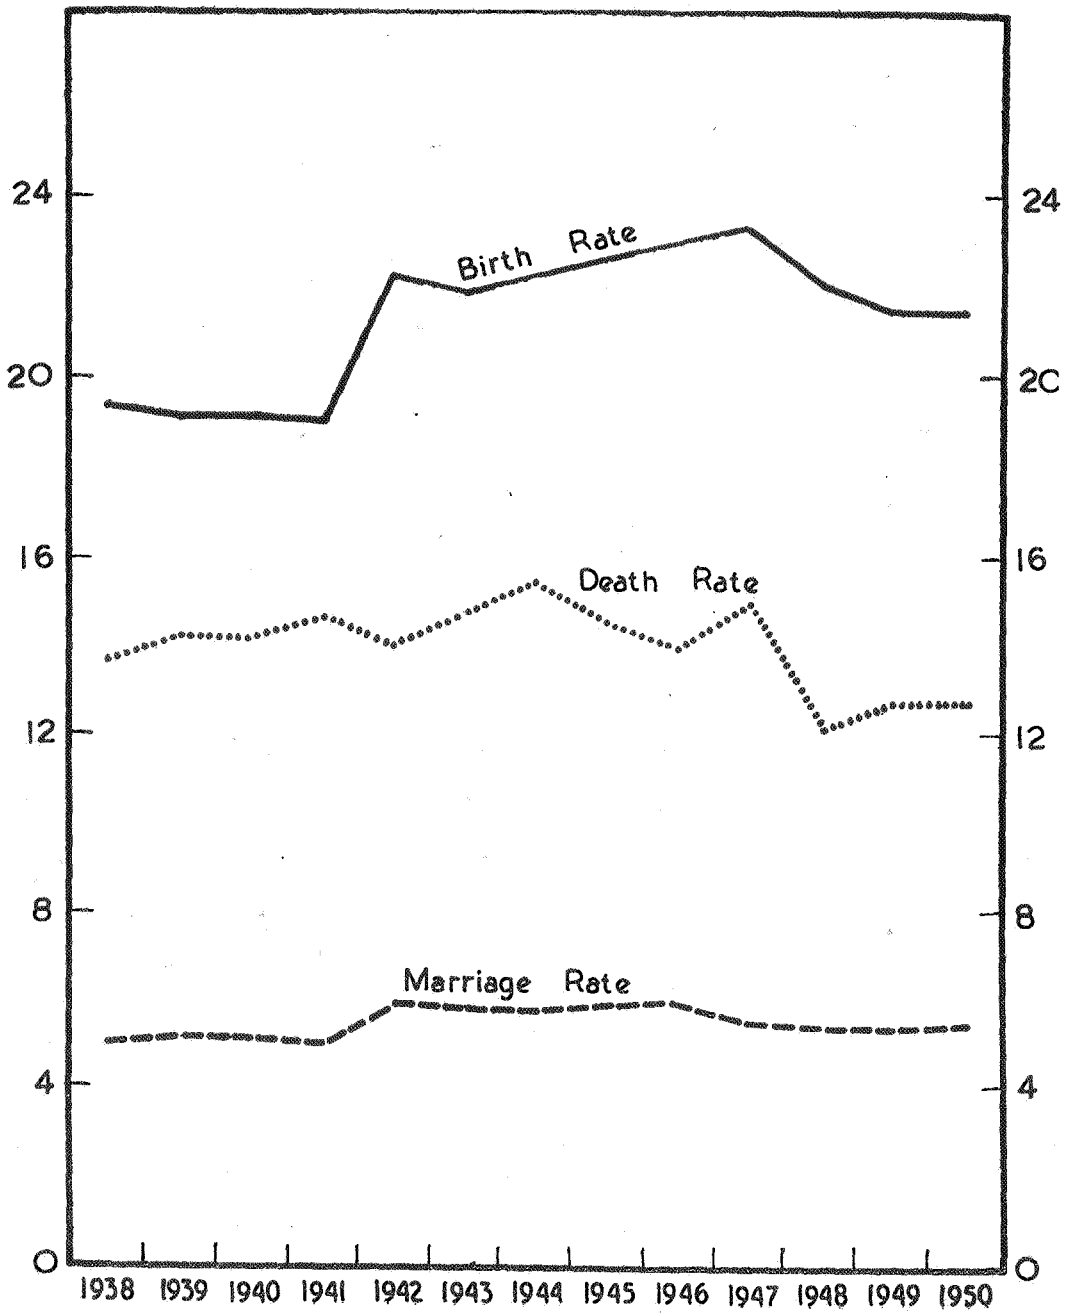

During 1950 the deaths of 2,922 infants under 1 year were registered, equivalent to a rate of 46 per 1,000 live births which is the lowest definitive rate yet recorded.

The total number of deaths from accidents and other external causes in 1950 was 905, of which road transport accidents accounted for 200 deaths.

Issue of Authority for Registration :—Births and deaths which have not been registered within 1 year of their occurrence can only be registered on the authority of an t-Árd Chláraitheoir. The actual number of births registered on the authority of an t-Árd-Chláraitheoir in 1950 was 1,120 and the number of deaths registered was 184. Throughout the tables in this Report these births and deaths have been excluded.

Population :—It is estimated that the population at the middle of 1950 was 2,969,000.

BIRTH. MARRIAGE AND DEATH RATES. 1938 - 1950.

MARRIAGES

There were 16,018 marriages registered during the year 1950. This figure is 9 more than that for the year 1949 and 486 less than the average for the decennial period 1940-49.

The annual rate per 1,000 population for the year 1950 was 5.40 compared with 5.36 in 1949. The rate for the decennial period ended with 1949 was 5.56 per 1,000 population. Table I shows the marriage rate for Ireland, the Six Counties, England and Wales and Scotland for each of the years 1938-50.

TABLE I.
NUMBER OF MARRIAGES PER 1,000 POPULATION IN IRELAND AND
NEIGHBOURING COUNTRIES, 1938-1950

Years	Ireland*	Six Counties	England and Wales	Scotland
1938	5.1	6.7	8.8	7.8
1939	5.2	7.1	10.6	9.2
1940	5.1	7.6	11.3	10.7
1941	5.0	9.3	9.4	9.5
1942	5.9	9.0	8.9	9.5
1943	5.9	7.8	7.2	7.6
1944	5.7	7.2	7.1	7.2
1945	5.9	7.9	9.3	9.5
1946	5.9	7.4	9.0	8.9
1947	5.5	7.1	9.3	8.6
1948	5.4	6.9	9.0	8.5
1949	5.4	6.8	8.5	8.1
1950	5.4	6.6	8.2	7.8

*Exclusive of the Six Counties.

The marriage rate in Ireland is abnormally low when comparison is made with England and Wales, Scotland and the Six Counties. The rate in 1950 is only two-thirds that in England and Wales. The rate in the State has been practically stable since 1947 but in the other areas shown there have been significant declines since 1947. Between 1944 and 1946 the marriage rate varied from 5.70 to 5.91 per 1,000 population. Although it has fallen somewhat since 1947 it is still higher than the rates in the decade preceding World War II.

Mode of Celebration

The number of marriages celebrated in accordance with the rites and ceremonies of the Catholic Church during 1950 amounted to 15,049 (equal to 94.0 per cent. of the total) and other marriages numbered 969. In the year 1950 the number of marriages other than Catholic recorded include 671 according to the rites and ceremonies of the Protestant Episcopal Church, 145 in Presbyterian Meeting Houses, 64 in registered buildings belonging to various other religious denominations, 70 by civil contract in the Registrars' Offices, 3 according to the usage of the Society of Friends and 16 according to Jewish rites.

At the Census of 1946 Catholics represented 94.3 per cent. of the population, Protestant Episcopalians 4.2 per cent., Presbyterians 0.8 per cent., Methodists 0.3 per cent. and Other Denominations 0.4 per cent.

The number of Catholic marriages recorded during 1950 is equal to a rate of 5.38 per 1,000 of the estimated Catholic population, a rate which is 0.23 below the average rate for the preceding ten years and the rate for all other marriages was 5.70 per 1,000 of all persons other than Catholics in the population or 0.94 above the average.

Corresponding rates for each year from 1940 to 1950 are shown in Table II.

TABLE II.

MARRIAGES REGISTERED IN 1950 AND IN EACH OF THE PREVIOUS TEN YEARS ACCORDING TO THE MODES OF CELEBRATION ; WITH THE RATES PER 1,000 POPULATION FOR CATHOLIC AND ALL OTHER MARRIAGES.

Marriage Rates by Counties

In making comparison of the marriage rates for each of the counties and county boroughs, it must be borne in mind that the rates are based on the total number of marriages recorded in each area irrespective of the fact that the persons married may not be residents of the area in which the marriage took place. An examination of the returns of marriages proves that many persons living in the rural portions of the country are married in the county boroughs and urban areas. This fact accounts in some measure for the high rates for the county boroughs. In 1950 these rates were, Dublin County Borough 8·2 per 1,000 population, Cork County Borough 9·7, Limerick County Borough 9·6. The lowest rates were recorded in Clare, 3·7 per 1,000 population, and in Roscommon, 3·8 per 1,000 population. Table III shows the rates for each county and county borough.

TABLE III

MARRIAGE RATES (PER 1,000 OF THE POPULATION) FOR COUNTIES, COUNTY BOROUGHS AND PROVINCES, FOR THE YEARS 1925-27, 1935-37, 1946 AND 1950, AND SHOWING FOR 1946 COMPARATIVE FIGURES OBTAINED FROM THE CENSUS OF POPULATION

Figures for the marriage rates in the counties for marriages which took place in the year preceding the date of the 1946 Census of Population are available and are also shown in Table III. These marriages are allocated to the area of residence of the wife on the date of the Census. In certain areas the figures are considerably different from the 1946 figures based on registered marriages. Thus the figures based on registrations in the County Boroughs are high particularly in the County Boroughs of Cork and Limerick, but the Census figures show that the rates based on area of residence do not differ appreciably from the general average of 5.6 per 1,000 population. The highest rate is 7.1 per 1,000 population in Limerick Co. Borough and the lowest is 4.5 per 1,000 population in Carlow.

Age at Marriage

The schedules to the Acts relating to marriage indicate that the law does not require that the ages of the contracting parties should be entered in the register or certificate. It is necessary that each party should be described as "of full age" or "minor" as the case may be with the result that a complete record of the ages of the persons married is not available.

TABLE IV.

PROPORTION OF PERSONS MARRIED NOT OF FULL AGE DURING THE YEARS
1940-1950.

Year	Total Marriages	Persons not of Full Age	
		Of 100 men married	Of 100 women married
1940	15,212	1.70	8.20
1941	15,021	1.84	7.96
1942	17,470	1.99	8.51
1943	17,328	1.56	7.48
1944	16,772	2.07	8.49
1945	17,301	1.51	7.69
1946	17,525	1.13	6.39
1947	16,290	1.50	7.03
1948	16,115	1.97	8.51
1949	16,009	2.09	7.35
1950	16,018	1.23	6.74

Table IV shows the proportion of persons married not of full age during the years 1940-50. The proportion of husbands who were stated to have married under age was 1.23 per cent. In the case of wives the proportion who were "minors" was 6.74 per cent.

BIRTHS

The information on births contained in this Report relates to live births only. All the figures relate to the year of registration and no figures are compiled for the year of occurrence. Up to the year 1942 the figures published for the numbers of births included all births registered, irrespective of the period between date of birth and date of registration. From 1943 the published figures exclude late registrations (births registered more than one year after the date of birth).

The downward trend in the number of births and in the birth rate, which was first evident in 1948, continued in 1950. The total number of births registered (exclusive of late registrations) was 63,565 compared with 64,153 in 1949. The birth rate per 1,000 population declined from 21.5 in 1949 to 21.4 in 1950. The following table shows the number of births and the birth rate in the State for each year since 1938, together with the birth rate in the Six Counties, England and Wales and Scotland during the same period.

TABLE V

NUMBER OF BIRTHS IN IRELAND* AND BIRTH RATES PER 1,000 POPULATION IN IRELAND* AND NEIGHBOURING COUNTRIES, 1938-50

Year	Ireland*		Six Counties	England and Wales	Scotland
	No. of births (thousands)	Birth rate per 1,000 population	Birth rate per 1,000 population		
1938	56.9	19.4	20.0	15.1	17.7
1939	56.1	19.1	19.5	14.9	17.4
1940	56.6	19.1	19.6	14.6	17.1
1941	56.8	19.0	20.8	14.2	17.9
1942	66.1	22.3	22.8	15.8	18.1
1943	64.4	21.9	24.2	16.2	18.4
1944	65.4	22.2	23.5	17.7	18.5
1945	66.9	22.7	22.0	15.9	16.9
1946	67.9	22.9	22.6	19.2	20.3
1947	69.0	23.2	23.3	20.5	22.0
1948	65.9	22.0	21.9	17.8	19.4
1949	64.2	21.5	21.4	16.7	18.5
1950	63.6	21.4	21.0	15.9	17.9

*Exclusive of the Six Counties.

There was a sudden increase in the birth rate from about 19 in the years 1938 to 1941 to 22.3 per 1,000 population in 1942. A slight decline occurred in 1943 and, thereafter, there was a continuous rise each year up to 1947 when the rate of 23.2 was recorded. This was the highest rate recorded for any individual year since 1884. On account of the introduction of rationing in 1941, there was a reduction in the time interval between birth and registration and more births were registered in 1942 than would otherwise have been the case. The rate shown for 1942 must, therefore, be considered as somewhat overstated in comparison with the other rates. Since 1947 there has been a decline each year in the birth rate but the 1950 rate of 21.4 per 1,000 population is still considerably higher than the pre-war average of 19.5 in the years 1929-1938.

The war-time and post-war increase in the birth rate also occurred in the Six Counties, England and Wales and Scotland as the table above shows. In England and Wales and in Scotland the highest birth rate in the period also occurred in 1947 and there has also been a decline each year since 1947 in these countries and in the Six Counties.

The marked changes in the birth rate which have occurred since 1942 may have been caused by changes in the numbers of married women at the reproductive ages or by changes in the fertility of married women. The marriage rate since 1942, as already observed, has been considerably higher than in pre-war years, and it reached a peak value in 1946. It can be inferred that the increase in the birth rate since 1942 must be due, at least partly, to the increased number of marriages. In order to ascertain whether any increase in marital fertility has also occurred it is desirable to relate legitimate births to the married women at the reproductive ages. The following table shows the birth rate per 1,000 Census population and the legitimate fertility

rate (number of legitimate births per 1,000 married women aged 15-44 years) for census periods since 1871. The standardised* rate represents the number of legitimate births which would have occurred per 1,000 married women if the age-distribution of married women at earlier Censuses had been the same as in 1946.

TABLE VI.

BIRTH RATES AND FERTILITY RATES 1870-72 TO 1945-47.

Period	Total births per 1,000 Census Population	Legitimate births per 1,000 married women 15-44 years	
		Crude	Standardised*
1870-2	27.5	306.6	287.1
1880-2	24.0	283.7	284.2
1890-2	21.7	287.4	293.6
1900-2	21.9	292.2	295.4
1910-2	22.7	305.4	317.8
1925-7	20.6	270.8	281.2
1935-7	19.4	256.1	267.0
1945-7	23.0	269.8	269.8

* The standardised rates represent what the rates would have been if the age distribution of the married women aged 15-44 at the earlier censuses had been the same as in 1946. The following method was used to calculate standardised rates:

From the numbers of births notified in Dublin City for years 1941-45 classified by age of mother, age specific fertility rates were computed which, when applied to the averages of the numbers of married women in 1941 and 1946 classified by age groups, resulted in the actual annual average number of births attributed to Dublin City in the years 1941-45. This fixed set of standard age specific fertility rates was then applied to the married women returned at each census in order to obtain an "expected" number of births. The "expected" number of births per married woman at each census was easily deduced and transferred to base 1946=unity. This last set of figures are standardising ratios and standardised rates were found by dividing each crude rate by the corresponding standardising ratio.

The birth rate fell rapidly from 1870-72 to 1890-92, rose slightly from 1890-92 to 1910-12 and then declined to reach its lowest value at any Census period in 1935-37. In the intercensal period 1936-46 a large increase in the birth rate, amounting to nearly 20 per cent., was recorded.

The crude and standardised fertility rates reached their peak values in 1910-12, and then declined significantly between 1910-12 and 1935-37. Since the declines in the crude and standardised rates were about equal the decline in fertility was not due to an increase in the average age of married women. On the other hand, between 1935-37 and 1945-47 the crude rate increased by about 5 per cent. and the standardised rate by about 1 per cent. Thus the real increase in marital fertility in the decade was only about 1 per cent. while the birth rate increased by nearly 20 per cent. It is, therefore, possible to ascribe the increased birth rate almost exclusively to the increased number of marriages, there being little change in marital fertility. It is possible that the increased numbers of marriages had the effect of temporarily increasing the fertility rate at the younger ages and for the earlier years of married life while the rate may have declined at the older ages, in which case a real decline in completed fertility may be hidden. The 1946 Census Report on Fertility of Marriage showed that fertility at durations of marriage under 5 years had shown an increase between 1911 and 1946. Unfortunately, since information as to the age of the mother at the time of the birth and since the parity of the maternity are not available, it is not possible

to make a detailed examination into this matter. That the population is reproducing itself with a substantial margin of safety is evident from the fact that the net reproduction rate in 1945-47 was 1.404 compared with 1.186 in 1935-37, an increase of 18 per cent. in the decade. The net reproduction rate represents the number of females who will replace each female at present in the reproductive period (15 to 44 years), assuming that the fertility rates and the mortality rate of females up to the end of the reproductive period remain constant at those levels which prevail during the period in question. Thus if these rates remained constant, 100 females aged 15-44 years in 1945-47 would be replaced by 140 females in that age group in the next generation.

Birth Rate by Area.

Table VII shows the crude birth rates in the provinces and in the Aggregate Urban and Aggregate Rural Districts in 1938 and for each year since 1945.

TABLE VII

BIRTH RATES PER 1,000 POPULATION IN THE PROVINCES AND IN THE URBAN AND RURAL DISTRICTS.

Area	1938	1945	1946	1947	1948	1949	1950
Dublin Co. Borough and County ...	23.8	23.6	25.0	25.5	24.9	24.2	22.6
Rest of Leinster ...	18.9	23.9	24.3	24.8	23.4	22.9	22.1
Munster ...	18.0	22.1	22.4	22.7	21.6	21.0	21.0
Connacht ...	17.4	20.6	20.7	20.9	20.0	19.4	20.2
Ulster (part of) ...	17.3	21.3	21.5	21.4	20.4	19.7	20.1
TOTAL ...	19.4	22.7	22.9	23.2	22.0	21.5	21.4
All County Boroughs and Urban Districts	22.7	24.4	25.1	25.9	24.7	23.8	21.9
All Rural Districts	17.8	21.8	21.9	22.0	21.1	20.7	21.1

EXPRESSED AS A PERCENTAGE OF THE BIRTH RATE IN THE STATE

Dublin Co. Borough and County ...	123	104	109	110	113	113	106
Rest of Leinster ...	97	105	106	107	106	107	103
Munster ...	93	97	98	98	98	98	98
Connacht ...	90	91	90	90	91	90	94
Ulster (part of) ...	89	94	94	92	93	92	94
TOTAL ...	100	100	100	100	100	100	100
All County Boroughs and Urban Districts	117	107	110	112	112	111	102
All Rural Districts	92	96	96	95	96	96	99

The interesting feature of this table is the tendency towards uniformity in the provincial and in the urban and rural rates. In 1938 the difference between the highest birth rate (23.8 per 1,000 population in Dublin County and County Borough) and the lowest rate (17.3 per 1,000 population in Ulster (part of)) was 6.5; in 1950, however, the corresponding difference was only 2.5. In 1950 the birth rate in Dublin County and County Borough was 1.2 per 1,000 below that of 1938 while the rates in the rest of Leinster and in the other provinces were 3 per 1,000 higher than in 1938. The large increase in the birth rate during World War II was practically confined to that part of the country outside Dublin County and County Borough.

The tendency towards uniformity is also evident in the urban and rural rates. In 1950 the urban rate decreased by 1.9 compared with 1949, while the rural rate increased by 0.4.

rate (number of legitimate births per 1,000 married women aged 15-44 years) for Census periods since 1871. The standardised* rate represents the number of legitimate births which would have occurred per 1,000 married women if the age-distribution of married women at earlier Censuses had been the same as in 1946.

TABLE VI.

BIRTH RATES AND FERTILITY RATES 1870-72 TO 1945-47.

Period	Total births per 1,000 Census Population	Legitimate births per 1,000 married women 15-44 years	
		Crude	Standardised*
1870-2	27.5	306.6	287.1
1880-2	24.0	283.7	284.2
1890-2	21.7	287.4	293.6
1900-2	21.9	292.2	295.4
1910-2	22.7	305.4	317.8
1925-7	20.6	270.8	281.2
1935-7	19.4	256.1	267.0
1945-7	23.0	269.8	269.8

* The standardised rates represent what the rates would have been if the age distribution of the married women aged 15-44 at the earlier censuses had been the same as in 1946. The following method was used to calculate standardised rates:

From the numbers of births notified in Dublin City for years 1941-45 classified by age of mother, age specific fertility rates were computed which, when applied to the averages of the numbers of married women in 1941 and 1946 classified by age groups, resulted in the actual annual average number of births attributed to Dublin City in the years 1941-45. This fixed set of standard age specific fertility rates was then applied to the married women returned at each census in order to obtain an "expected" number of births. The "expected" number of births per married woman at each census was easily deduced and transferred to base 1946=unity. This last set of figures are standardising ratios and standardised rates were found by dividing each crude rate by the corresponding standardising ratio.

The birth rate fell rapidly from 1870-72 to 1890-92, rose slightly from 1890-92 to 1910-12 and then declined to reach its lowest value at any Census period in 1935-37. In the intercensal period 1936-46 a large increase in the birth rate, amounting to nearly 20 per cent., was recorded.

The crude and standardised fertility rates reached their peak values in 1910-12, and then declined significantly between 1910-12 and 1935-37. Since the declines in the crude and standardised rates were about equal the decline in fertility was not due to an increase in the average age of married women. On the other hand, between 1935-37 and 1945-47 the crude rate increased by about 5 per cent. and the standardised rate by about 1 per cent. Thus the real increase in marital fertility in the decade was only about 1 per cent. while the birth rate increased by nearly 20 per cent. It is, therefore, possible to ascribe the increased birth rate almost exclusively to the increased number of marriages, there being little change in marital fertility. It is possible that the increased numbers of marriages had the effect of temporarily increasing the fertility rate at the younger ages and for the earlier years of married life while the rate may have declined at the older ages, in which case a real decline in completed fertility may be hidden. The 1946 Census Report on Fertility of Marriage showed that fertility at durations of marriage under 5 years had shown an increase between 1911 and 1946. Unfortunately, since information as to the age of the mother at the time of the birth and since the parity of the maternity are not available, it is not possible

The crude birth rate is affected by the age distribution of the population, the numbers of women at the reproductive ages, the proportion of these who are married and the fertility of married women. It is, therefore, advisable to relate total births to the number of women aged 15-44 years and legitimate births to the married women at the same ages. This has been done in Table VIII which shows the results for each county. Standardised rates are also shown in this table. These rates indicate what fertility would have been in each county if the age distribution of the married women in each county had been the same as that in the State. They, therefore, eliminate the effect on the crude rate of differences in the age distribution of married women between the counties.

TABLE VIII

NUMBER OF BIRTHS IN 1950 PER 1,000 POPULATION AND PER 1,000 FEMALES AGED 15-44 AND
NUMBER OF LEGITIMATE BIRTHS PER 1,000 MARRIED FEMALES AGED 15-44 IN EACH
COUNTY AND COUNTY BOROUGH

ULSTER (part of) ...	20.1	111.1	259.3	260.9
TOTAL ...	21.4	106.5	249.0	249.0

The crude birth rates vary from 16.9 per 1,000 population in Leitrim to 25.6 in Kildare. After Kildare the areas with the largest birth rates are Limerick County (24.0), Westmeath (23.3), Carlow (23.2), Limerick Co. Borough (23.1), Dublin County and Waterford Co. Borough (23.0). The lowest birth rates occur in Leitrim (16.9), Roscommon (17.7), Waterford County (18.2) and Cavan (18.6).

The provincial figures for total births per 1,000 women aged 15-44 years are practically the same but there is considerable variation among the county figures. The lowest rates occur in Dublin Co. Borough (90.7) and in Cork Co. Borough (92.5), although the birth rates in these county boroughs are higher than average. The reason is that the proportion of females to males in the county boroughs is higher than in the remainder of the country. The highest figures for total births per 1,000 females aged 15-44 occur in Kildare (140.5) and in Limerick County (131.0).

The number of legitimate births per 1,000 married women was 249.0 in 1950. The range of variation is from 213.5 in Dublin County to 281.6 in Galway. The provincial figures are fairly uniform, the lowest figure being 241.9 in Leinster and the highest 267.8 in Connacht. Leinster has also the lowest standardised rate (237.0) and Connacht the highest (276.4). The highest standardised rate occurs in Galway (286.2) and the lowest rate in Dublin County (216.7). The most striking fact shown by the table is that while Leinster has the highest birth rate among the provinces, it has the lowest standardised fertility rate. On the other hand Connacht, which has a birth rate only 0.1 above the lowest rate, has the highest fertility rate.

Illegitimate Births

There were 1,627 illegitimate births registered in 1950. This represents 2.6 per cent. of all births registered. The proportion of illegitimate births rose from 3.2 per cent. in 1939 to 3.9 per cent. in the years 1944-46. Between 1946 and 1950 there was a decline each year in the proportion. The percentage of illegitimate births in each of the provinces is shown in Table IX.

TABLE IX.

ILLEGITIMATE BIRTHS AS A PERCENTAGE OF TOTAL BIRTHS 1938-50 IN EACH PROVINCE

Year	Total	Dublin Co. Boro' and County	Rest of Leinster	Munster	Connacht	Ulster (part of)
1938	3.3	2.8	4.1	3.4	2.2	4.3
1939	3.2	2.5	4.4	3.2	1.9	4.3
1940	3.2	2.2	4.8	3.4	1.9	3.9
1941	3.5	2.6	4.8	3.6	2.3	4.4
1942	3.7	2.5	5.0	3.8	2.5	4.6
1943	3.8	3.0	5.0	4.2	2.3	4.2
1944	3.9	3.0	5.2	4.0	2.4	5.0
1945	3.9	3.0	5.3	4.1	2.4	4.7
1946	3.9	2.8	5.2	4.2	2.6	4.5
1947	3.4	2.8	4.4	3.5	2.2	4.3
1948	3.3	2.5	4.3	3.7	1.7	4.0
1949	3.1	2.4	4.2	3.2	1.9	4.0
Average 1940-49	3.6	2.7	4.8	3.8	2.2	4.4
1950	2.6	2.0	3.5	2.8	1.5	2.9

The highest percentages occur in Leinster (excluding Dublin County and County Borough) and in Ulster (part of), while the lowest percentages occur in Connacht. The highest percentages were in the following counties: Limerick County (4·8), Kilkenny and Wexford (4·4), Carlow (3·9) and Westmeath (3·8).

The counties with the lowest rates were: Mayo (0·8), Roscommon (1·3), Leitrim and Limerick County Borough (1·4), Cork County Borough (1·6), Dublin County Borough, Dun Laoghaire Borough, Sligo and Kerry (1·8), Galway (1·9).

Proportion of Males to Females.

The number of male births registered in 1950 was 32,867 and the number of females was 30,698. The sex ratio was 1,071 males per 1,000 females compared with 1,051 in 1949. The sex ratio for each year since 1938 is shown in Table X and legitimate and illegitimate births are distinguished.

TABLE X.

NUMBER OF MALE BIRTHS PER 1,000 FEMALE BIRTHS, 1938-50.

Year	Legitimate	Illegitimate	Total
1938	1044	1134	1046
1939	1055	1085	1056
1940	1056	963	1053
1941	1059	1040	1059
1942	1056	1158	1059
1943	1070	1008	1068
1944	1059	1028	1058
1945	1057	1014	1056
1946	1070	1092	1071
1947	1071	1089	1071
1948	1064	1076	1064
1949	1050	1101	1051
Average 1940-49 ...	1061	1057	1061
1950	1074	965	1071

Since 1938 the sex ratio has varied from 1,046 to 1,071. As is to be expected on account of the smaller numbers of illegitimate births the variation is wider for these than for legitimate births; the lowest figure is 963 and the highest 1,158. The variability from year to year in both the legitimate and illegitimate classes may be attributed to chance.

Multiple Births

The number of infants born alive in multiple births registered during 1950 was 1,763, consisting of 862 pairs of twins and 13 sets of triplets as compared with 1,829 (898 pairs of twins and 11 sets of triplets) for the previous year. The numbers of multiple births as a percentage of total births for each year since 1938 are shown in Table XI, distinguishing legitimate and illegitimate births.

TABLE XI.

MULTIPLE BIRTHS AS A PERCENTAGE OF TOTAL BIRTHS, 1938-50.

Year	Legitimate Births	Illegitimate Births	Year	Legitimate Births	Illegitimate Births
1938 ...	2.5	2.0	1946 ...	2.3	1.7
1939 ...	2.5	1.6	1947 ...	2.8	2.3
1940 ...	2.4	1.3	1948 ...	2.6	2.0
1941 ...	2.2	1.6	1949 ...	2.9	1.5
1942 ...	2.4	2.8	Average 1940-49 ...		
1943 ...	2.6	2.2			
1944 ...	2.7	2.6		2.6	2.0
1945 ...	2.8	1.6	1950 ...	2.8	2.5

It is significant that the percentage of multiple births is higher each year except 1942 for legitimate births than for illegitimate births.

Late Registrations.

As stated on Page 1, the figures for numbers of births exclude late registrations, *i.e.*, births registered more than 1 year after occurrence. A considerable number of such births is registered every year. The number in 1950 was 1,120. The inclusion of these births would change the birth rate from 21.4 to 21.8 per 1,000 population.

DEATHS

The number of deaths registered during the year 1950 was 37,741, the males numbering 20,026 and the females 17,715. The total is 321 less than the number for 1949 and 4,123 less than the average for the decennial period 1940-49.

The death rate in 1950 was 12.7 per thousand population, the same as that for 1949. This rate is 0.6 above that for 1948, which, however, was the lowest annual rate ever recorded. The average rate for the period 1940-49 was 14.1 per thousand population.

Table XII shows the number of deaths in the State for each year since 1938 and compares the annual death rate with those in the Six Counties, England and Wales, and Scotland.

TABLE XII.

DEATH RATE PER 1,000 POPULATION IN IRELAND AND NEIGHBOURING COUNTRIES,
1938-1950.

Year	Ireland *		Six Counties	England and Wales	Scotland
	No. of Deaths (thousands)	Death rate per 1,000 population	Death rate per 1,000 population		
1938 ...	40.0	13.6	13.7	11.6	12.6
1939 ...	41.7	14.2	13.5	12.1	12.9
1940 ...	41.9	14.2	14.6	14.4	14.9
1941 ...	43.8	14.6	15.2	13.5	14.7
1942 ...	41.6	14.1	13.3	12.3	13.3
1943 ...	43.5	14.8	13.4	13.0	14.0
1944 ...	45.1	15.3	12.8	12.7	13.6
1945 ...	42.8	14.5	12.3	12.6	13.2
1946 ...	41.5	14.0	12.5	12.0	13.1
1947 ...	44.1	14.8	12.6	12.3	12.9
1948 ...	36.4	12.1	11.2	11.0	11.8
1949 ...	38.1	12.7	11.5	11.8	12.3
1950 ...	37.7	12.7	11.6	11.6	12.4

*Exclusive of the Six Counties

For each year since 1941 the death rate in this country is the highest in the table. In 1950 the crude death rate in the State was nearly 10 per cent. higher than the death rates in the Six Counties and in England and Wales. The 1950 rates have been standardised to the 1946 population of Ireland*, and the standardised rates are as follows :—Ireland* (12.71), Six Counties (11.81), England and Wales (10.90) and Scotland (12.29). The rate in Ireland* is still the highest.

Deaths by Age

Table XIII shows the death rate in different age groups between 1901 and 1950.

TABLE XIII.

DEATHS OF PERSONS PER 1,000 CORRESPONDING POPULATION IN DIFFERENT AGE GROUPS,
1901—10 TO 1941—50.

Period	Age Groups												Crude rate per 1,000 population	Standard- ised* rate per 1,000 population
	Under 5	5-9	10-14	15-19	20-24	25-34	35-44	45-54	55-64	65-74	75-84	85+

*Standardised by weighting individual ratios by corresponding total populations.

Between 1901-1910 and 1941-50 the total death rate declined from 16.91 to 13.97 per thousand population, or by 17 per cent., but the decline is understated since in the interval the age distribution of the population has become more unfavourable from the standpoint of mortality. Standardised rates eliminate differences arising from the different age distributions of the population, and the last column of Table XIII shows the rates standardised to the 1946 population distribution. The standardised rate fell from 18.96 per 1,000 population in 1901-10 to 14.28 per thousand population in 1941-50 or by 25 per cent. The improvement in death rates since the beginning of the present century has been effected mainly at ages up to 55 years, particularly at ages 5-19 years and 25-34 years, at which ages the 1941-50 rates are less than half those of 1901-10. At ages under 5 years, 20-24 years and 35-44 years the death rates declined by nearly half. At ages 45-64 years there were substantial though less marked declines, but at ages over 65 years there were no significant changes. The figures for recent years show that there have been significant declines in death rates at ages up to 55 years since 1947, while at ages over 55 years there have been increases since 1948.

Table XIV shows the ratio of male to female mortality at different ages.

For each of the periods shown in the table the crude male death rate was higher than the female rate except in 1921-30. This is partly due to the different age distributions of males and females for when the ratios are standardised in order to eliminate these differences, female mortality is slightly higher than male mortality in 1901-10, 1921-30, and 1931-40. Both sets of figures show a tendency for the male mortality to increase relative to the female mortality since 1921.

At ages under 20 years and at ages 55-84 years, the ratio of male to female mortality has shown an upward tendency between 1901-10 and 1941-50. On the other hand at ages 20-34 years the ratio has declined since 1901-10 while at ages 35-54 years the tendency is not uniform. Figures for recent years indicate that there is considerable variation in the ratios for some age groups, mainly due to the fact that the numbers of deaths in these age groups are small in any one year.

Deaths in each quarter

Table XV shows quarterly death rates in 1921-30, 1931-40 and 1941-50.

TABLE XV.
DEATH RATES BY QUARTERS

Period	First Quarter	Second Quarter	Third Quarter	Fourth Quarter	Total
Rate per 1,000 population					
1921-30 ...	17.4	15.4	11.8	13.2	14.5
1931-40 ...	17.5	14.3	11.6	13.3	14.2
1941-50 ...	17.5	14.2	11.4	12.8	13.9
As percentage of total rate					
1921-30 ...	120	106	81	91	100
1931-40 ...	123	101	82	94	100
1941-50 ...	126	102	82	92	100

The rate is highest in the March quarter and lowest in the September quarter. On account of the time lag between date of death and date of registration, quarterly death rates do not truly reflect the actual experience in each quarter, and for this reason the figures must be accepted with reserve when comparisons are made.

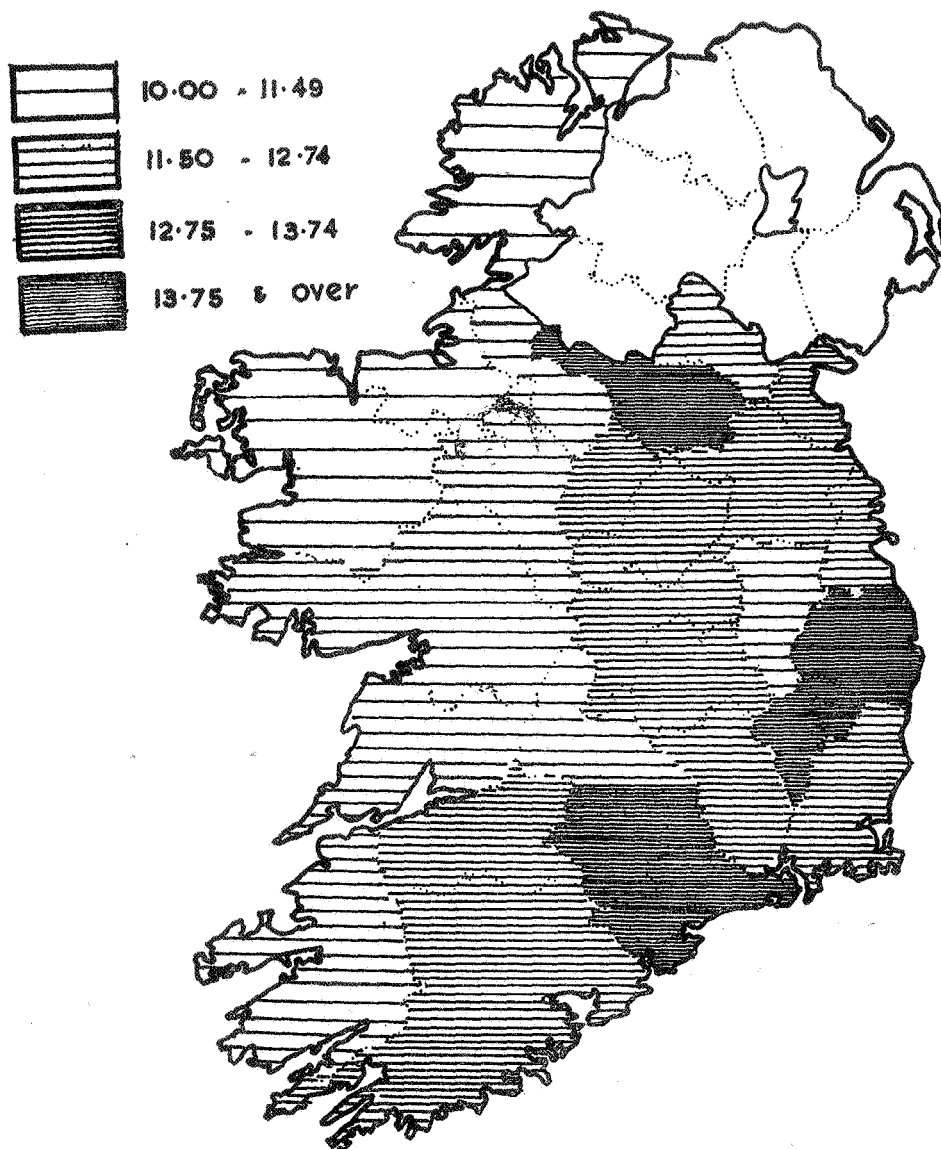

Deaths by Counties

Table XVI shows the crude and standardised death rates in each county and county borough in 1950.

TABLE XVI
CRUDE AND STANDARDISED DEATH RATES IN EACH COUNTY AND COUNTY
BOROUGH IN 1950

County, etc.	Deaths per 1,000 population

Monaghan	13.15	12.72
ULSTER (part of)	13.61	12.34
TOTAL	12.71	12.71

Standardised Death Rate (per 1,000 population), from
all causes 1950.

The crude rate varies from 8.85 per thousand population in Dublin County (exclusive of Dún Laoghaire Borough) to 15.56 per thousand population in Cavan. The effect of standardisation is to reduce this range of variation. The lowest standardised rate is 10.45 in Dublin County (exclusive of Dún Laoghaire)

TABLE XVII

CRUDE AND STANDARDISED DEATH RATES IN EACH COUNTY AND COUNTY BOROUGHS IN 1925-27 AND 1945-47.

County or County Borough	Crude Rates per 1,000 population			Standardised Rates per 1,000 population		
	1925-1927	1945-1947	Percentage decrease (+ = increase)	1925-1927	1945-1947	Percentage decrease (+ = increase)
Carlow	15.0	15.2	+ 1.3	16.4	15.3	- 6.7
Dublin County Borough	16.4	13.7	- 16.5	23.0	17.1	- 25.7

Kerry	12.5	14.3	+ 14.4	13.7	13.4	- 2.2
Limerick Co. Borough	16.6	14.8	- 10.8	24.1	18.6	- 22.8
Limerick County ...	14.2	14.0	- 1.4	15.8	13.9	- 12.0
Tipperary N.R.	14.3	14.9	+ 4.2	15.6	14.7	- 5.8
Tipperary S.R.	14.9	14.7	- 1.3	17.2	14.5	- 15.7
Waterford Co. Borough	15.3	18.6	+ 21.6	19.7	21.0	+ 6.6
Waterford County ...	14.5	13.2	- 9.0	15.6	12.5	- 19.9
MUNSTER	14.1	14.8	+ 5.0	15.9	14.4	- 9.4
Galway	12.9	14.2	+ 10.1	13.3	13.6	+ 2.3
Leitrim	15.1	16.3	+ 7.9	13.9	14.0	+ 0.7
Mayo	12.5	14.4	+ 15.2	12.3	12.0	- 2.4
Roscommon	13.8	14.9	+ 8.0	13.0	12.4	- 4.6
Sligo	14.6	16.4	+ 12.3	14.1	14.2	+ 0.7
CONNACHT	13.4	14.8	+ 10.4	13.1	13.0	- 0.8
Cavan	14.6	15.8	+ 8.2	14.5	14.2	- 2.1
Donegal	14.9	14.4	- 3.4	14.5	12.8	- 11.7
Monaghan	15.4	14.7	- 4.5	15.6	14.2	- 9.0
ULSTER (part of)	14.9	14.9	0.0	14.7	13.5	- 8.2
TOTAL	14.5	14.5	0.0	16.1	14.5	- 9.9

and the highest at 15.89 in Waterford County Borough. It will be observed that standardisation raises the death rates in the county boroughs and lowers them in all the counties in Munster, Connacht and Ulster. The crude rates, of course, are markedly

affected by the different age distributions of the population and standardisation eliminates the effect of age on the death rate. The corrected death rates are highest in the county boroughs and lowest in the rural counties of the west and north-west.

Table XVII shows that while there has been no decrease in the crude death rates for the country as a whole when the periods 1925-7 and 1945-7 are compared, the standardised death rate, on the other hand, decreased from 16.1 to 14.5 per thousand population in the same period. The ageing of the population, therefore, has prevented a real decline in mortality being reflected in the crude death rate.

The standardised death rate decreased in nearly all counties between 1925-27 and 1945-47, the largest percentage decrease occurring in Dublin County Borough. Increases, however, were recorded in Counties Clare, Galway, Leitrim, Sligo and in Waterford County Borough.

Causes of Death

Most of the tables in this report showing causes of death for 1950 are based on the Sixth Revision of the International List of Diseases, Injuries and Causes of Death, 1948, but in the case of Table 26 a classification has been made according to the Fifth Revision of the International List, while Table 27 shows a cross-classification of the deaths according to the 1948 and 1938 International Lists. The purpose of these two tables is to indicate the effect of the latest change in classification. For the 1940-49 Reports of the Registrar-General the Fifth Revision of the International List was used to classify causes of death.

In Table 19 relating to the whole country causes of death by ages are shown and the classification adopted is the detailed International List. In Table 20 causes of death are classified by (i) ages and (ii) place of death, and the number of deaths uncertified in each cause are shown for each county and county borough: the classification used is that of the International Abbreviated List, slightly extended. The same classification is used in Table 21 showing causes of death for each urban district.

The proportion of deaths in 1950 from the principal causes in certain age groups is shown in Table XVIII.

It will be observed that, taking all ages into account, Diseases of the Heart caused the largest proportion of deaths, namely 277 in each thousand deaths. The next in order are Senility (125), Malignant Neoplasms (108), Vascular Lesions affecting Central Nervous System (71) and Tuberculosis all forms (63).

As is to be expected the principal cause of death varies between age groups. At ages under 1 year a group of deaths described as Congenital Malformations and Diseases of Early Infancy accounted for 588 out of every thousand deaths, Pneumonia accounted for a further 130, and Diarrhoea and Enteritis for 85. At ages 1-4 years Pneumonia caused 184 per thousand deaths and Tuberculosis 152 per thousand deaths. The proportion of deaths caused by Tuberculosis becomes higher as age increases. At ages 5-14 years 234 per thousand deaths were caused by this disease. At ages 15-24 years the proportion was 483 per thousand deaths and at ages 25-34 it was 484 per thousand deaths. Thereafter the proportion decreases as age increases though at ages 35-44 years it is still considerable. In 1950 the deaths from tuberculosis in this age group were 292 per thousand deaths. Between ages 45 and 75 the chief causes of death were Heart Diseases and Malignant Neoplasms, while at ages over 75 years Heart Diseases and Senility each accounted for nearly one-third of the deaths at these ages.

Table XIX shows the numbers of deaths and death rates in 1925-27, 1935-37, 1945-47 and 1948-50 from the principal causes. The classification is based on the Fifth Revision of the International List.

TABLE XIX

NUMBER OF DEATHS AND DEATH RATES PER 100,000 POPULATION FROM PRINCIPAL CAUSES,
1925-27 TO 1948-50

Causes of death	Period				Period

The main feature of this table is the decline in the number of deaths and death rates for the main infective and parasitic diseases. Deaths from diseases of the respiratory system also decreased significantly. On the other hand deaths from Cancer, Heart Diseases and Vascular Lesions affecting the Central Nervous System have increased considerably. How far these changes may be ascribed to changes adopted by medical practitioners in the certification of cause of death when more than one cause of death has contributed to the fatal outcome is unknown. In cases where two causes of death, *e.g.*, Heart Disease and a Respiratory Disease have each played some part in causing death, the choice of the underlying cause of death is often difficult. The new international form of medical certificate of cause of death together with the accompanying rules for selection of the underlying cause of death for tabulation is designed to produce uniformity between all medical practitioners in this respect.

Infective Diseases

In 1950 there were 2,709 deaths caused by infective and parasitic diseases. The main infective disease causing death is, of course, Tuberculosis, and there were 2,380 deaths from Tuberculosis in 1950. Excluding Tuberculosis the remaining infective diseases caused 329 deaths. The number caused by Typhoid and Paratyphoid Fevers was 12, Scarlet Fever caused 8 deaths, Diphtheria 5 deaths, Whooping Cough caused 65 deaths, and 35 deaths were due to Measles. Acute Poliomyelitis (including late effects) caused 31 deaths, and Acute Encephalitis (including late effects) caused 8 deaths.

Tuberculosis

Table XX shows the death rates from all forms of Tuberculosis in Ireland and neighbouring countries since 1938.

TABLE XX

DEATHS PER 1,000 POPULATION FROM TUBERCULOSIS IN IRELAND AND
NEIGHBOURING COUNTRIES, 1938-1950

Year	Ireland*	Six Counties	England and Wales	Scotland
1938	1.09	0.92	0.64	0.69
1939	1.13	0.84	0.63	0.70
1940	1.25	0.98	0.70	0.82
1941	1.24	1.04	0.73	0.83
1942	1.47	0.97	0.66	0.80
1943	1.46	0.91	0.67	0.79

1946	1.14	0.83	0.53	0.79
1947	1.24	0.72	0.56	0.79
1948	1.04	0.69	0.51	0.76
1949	0.91	0.59	0.46	0.67
1950	0.80	0.48	0.36	0.54

* Exclusive of the Six Counties

The death rate in this country, which was 1.09 per thousand population in 1938, increased during the war years to 1.47 in 1942 since when, with the exception of the year 1947, there has been a downward trend. The improvement between 1938 and 1950 has been less spectacular here than in the Six Counties and England and Wales where the 1938 rates have been practically halved. The 1950 rate in this country is more than twice that in England and Wales and is also considerably higher than the rates in the Six Counties and in Scotland.

Table XXI shows the number of deaths and death rates from Tuberculosis of the Respiratory System and from all other forms of Tuberculosis per thousand population for each year since 1938.

DEATH RATES (PER 1000 POPULATION) FROM
TUBERCULOSIS AND CANCER 1938 - 1950.

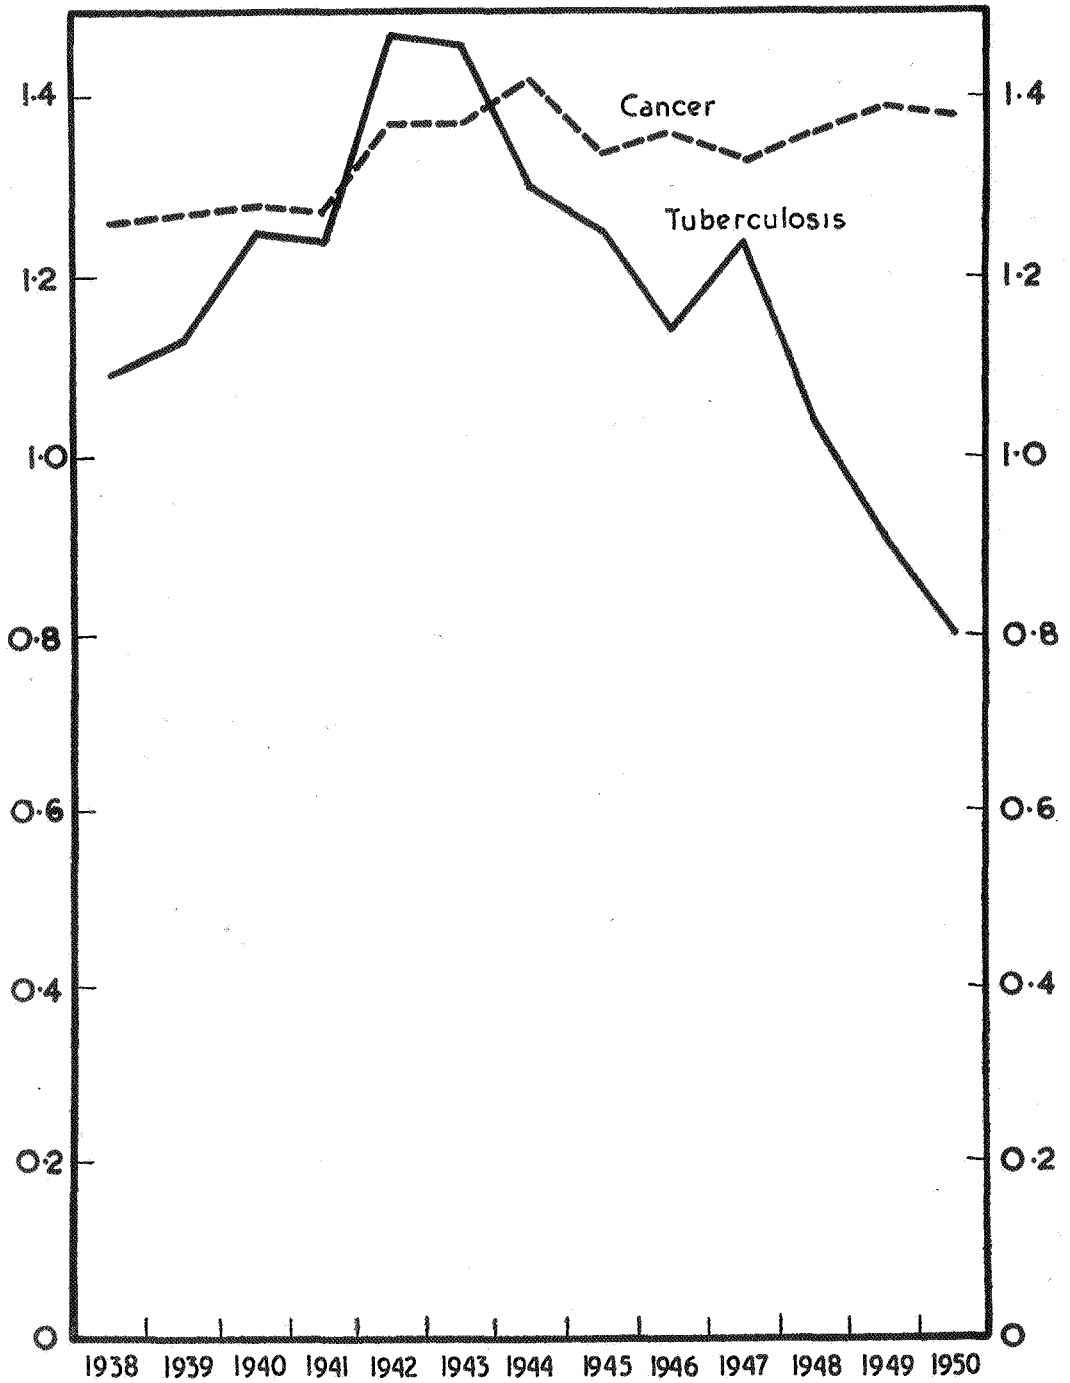

TABLE XXI

NUMBERS OF DEATHS AND DEATH RATE FROM TUBERCULOSIS OF RESPIRATORY SYSTEM AND FROM ALL OTHER FORMS OF TUBERCULOSIS PER 1,000 POPULATION

Year	Tuberculosis of Respiratory System		Other forms of Tuberculosis		Ratio of male to female mortality	
	Number	Rate per 1,000 population	Number	Rate per 1,000 population	Tuberculosis of Respiratory System	Other forms of Tuberculosis

1948	2,452	0.82	651	0.22	1.08	1.20
1949	2,142	0.72	570	0.19	1.06	1.00
1950	1,876	0.63	504	0.17	1.19	0.89

In 1950 there were 2,380 deaths from Tuberculosis, of which 1,876 were caused by Tuberculosis of the Respiratory System and 504 by all other forms of Tuberculosis. The decrease between 1938 and 1950 in the rate for Tuberculosis of the Respiratory System was 26 per cent. and for all other forms of Tuberculosis it was 29 per cent.

Table XXII shows the death rates from all forms of Tuberculosis at different ages in 1925-27, 1935-37, 1945-47 and 1948-50.

TABLE XXII

DEATH RATES FROM ALL FORMS OF TUBERCULOSIS AT DIFFERENT AGES PER 1,000 CORRESPONDING POPULATION 1925-27, 1935-37, 1945-47 AND 1948-50.

1935-37	0.53	1.36	2.25	2.18	1.63	1.32	0.71	1.22
1945-47	0.52	1.40	2.17	1.99	1.58	1.38	0.87	1.22
1948-50	0.34	0.78	1.46	1.54	1.29	1.20	0.75	0.92
RATIO — MALE / FEMALE								
1925-27	0.89	0.63	0.82	0.94	1.03	1.28	1.44	0.95
1935-37	0.96	0.71	0.80	0.86	1.29	1.37	1.59	1.02
1945-47	1.04	0.70	0.73	0.90	1.13	1.56	1.60	1.04
1948-50	1.03	0.59	0.73	0.88	1.14	1.74	1.80	1.08

The most interesting fact revealed by this table is that in 1948-50 the highest rate for males was at ages 45-54 years while the female rate was highest at ages 20-24 years. At ages 15-34 years the male rate is lower than the female, but at ages 35 years and over the male rate is higher, the difference increasing with increasing age.

In the last 25 years the improvement in the male rates has been confined almost wholly to age groups under 45 years. The most striking improvement occurred at ages 15-19 years. In this age group the 1948-50 rate is less than half that for 1925-27. In the age group 20-24 years the rate had been almost halved in the past 25 years. At ages over 45 years there has been little change since 1925-27. In 1925-27 and 1935-37 the highest male rate occurred in the age group 20-24 years. In 1945-47 the highest male rate was at ages 25-34 years, while, as already stated, in 1948-50 the highest male rate was at ages 45-54 years. The position for females is different. Since 1925-27 considerable improvements in the death rate have been effected at ages up to 55 years. For each period shown in the table the highest death rate occurred at ages 20-24 years.

Table XXIII shows death rates from Tuberculosis in different age groups per 1,000 corresponding population in Ireland and neighbouring countries in 1948-50.

TABLE XXIII

DEATHS FROM TUBERCULOSIS (ALL FORMS) IN CERTAIN AGE GROUPS PER 1,000 CORRESPONDING POPULATION, 1948-50

Age Groups	Ireland*	Six Counties	England and Wales	Scotland	Index Numbers (Ireland = 100)

Standardised† ...	0.92	0.59	0.42	0.64	100	64	48	71

*Exclusive of the Six Counties.

†Standardised to the 1946 population of Ireland*.

The highest rate of mortality is in the age group 25-34 years in Ireland (exclusive of the Six Counties) and England and Wales. In the Six Counties the highest rate is at ages 45-54 years and in Scotland it occurs at ages 20-24 years. The rate in Ireland (exclusive of the Six Counties) declines with advancing age after age 35 years, but in the Six Counties and England and Wales there is a considerable degree of uniformity in the death rate at all ages over 20 years. In Scotland the death rate decreases after 25 years of age.

While the Tuberculosis death-rate in 1948-50 at all ages in the Six Counties is 64 per cent. of the rate in this country, in England and Wales it is 48 per cent. and in

Scotland 71 per cent. There are, however, considerable differences when the comparisons are made for different age groups. In the Six Counties the death-rate in the age group under 15 years is 68 per cent. of that in this country, and the ratio drops fairly sharply to 49 per cent. at 20-24 years and then increases steadily to 96 per cent. of our rate at ages 55 and over. In England and Wales, on the other hand, the rates for different age-groups up to 44 years vary between 36 and 42 per cent. of the corresponding Irish rates, and the ratio climbs to 75 per cent. in the group over 55 years.

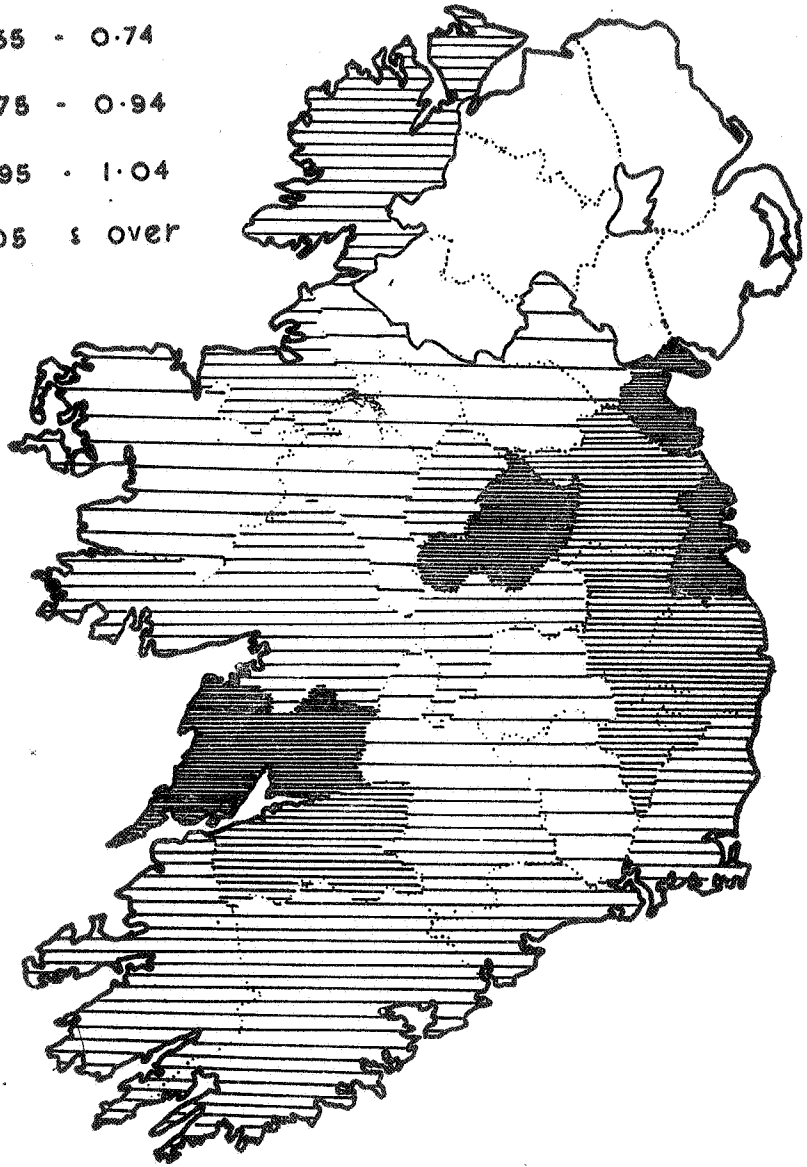

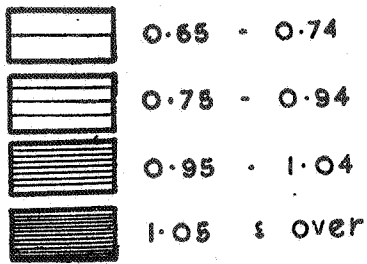

TABLE XXIV

AVERAGE ANNUAL DEATH RATES FROM ALL FORMS OF TUBERCULOSIS PER 1,000 POPULATION IN EACH COUNTY AND COUNTY BOROUGH, 1925-27 AND 1948-50.

*Standardised to the 1946 total population.

Standardised Death Rate (per 1,000 population) from
Tuberculosis. 1948 - 50.

Percentage decline in Tuberculosis Mortality Rates between
1925-27 and 1948-50.

of age. The Scottish rate, which is 71 per cent. of that in this country under 15 years of age, is 92 per cent. of the Irish rate at 15-19 years. The ratio falls steadily to 55 per cent. in the group 45-54 years and at ages of 55 years and over it again rises to 75 per cent. of the corresponding Irish rate.

Table XXIV shows crude and standardised death rates in each county and county borough for the years 1925-27 and 1948-50.

In this table standardisation eliminates differences arising on account of the different age distributions of the populations of the counties. The effect of standardisation in this instance is in general small. The standardised rate for the whole State has declined by 39.1 per cent. over the whole period as compared with a decrease of 38.7 per cent. in the crude rate. The largest rates of decline in the standardised figures are recorded in Waterford County (55.7 per cent.), Laoighis (51.0 per cent.), Kilkenny (49.7 per cent.), Dún Laoghaire Borough and Wexford (48.0 per cent.) The lowest rates of decline occurred in Roscommon (12.2 per cent.), Longford (16.3 per cent.), Clare (19.1 per cent.).

In 1948-50 the highest rates occurred in the County Boroughs and in Counties Dublin, Louth, Westmeath and Clare. The lowest rates were recorded in Kilkenny, Laoighis, Tipperary N.R., Waterford County, Leitrim, Mayo, Roscommon, Cavan and Monaghan; in each of these counties the rates, either crude or standardised, were below 0.8 per thousand population.

Cancer

Up to 1949 Cancer deaths have been taken as Nos. 045-055 of the Fifth Revision of the International List of Causes of Death. As already observed the deaths in 1950 have been classified according to the Sixth Revision of the International List. It has been recommended by the World Health Organisation that total Cancer deaths should be based upon Nos. 140-205 of the International Statistical Classification, 1948, but

TABLE XXV

DEATHS FROM CANCER IN IRELAND AND NEIGHBOURING COUNTRIES
PER 1,000 POPULATION, 1938-1950

Year	Ireland*	Six Counties	England and Wales	Scotland
1938	1.26	1.32	1.67	1.62
1939	1.27	1.33	1.66	1.61
1940	1.28	1.36	1.72	1.70
1941	1.27	1.37	1.78	1.69
1942	1.37	1.41	1.83	1.71
1943	1.37	1.45	1.90	1.73
1944	1.42	1.41	1.90	1.86
1945	1.34	1.44	1.74	1.92
1946	1.36	1.42	1.77	1.80
1947	1.33	1.47	1.81	1.77
1948	1.36	1.45	1.86	1.81

1950	1.38	1.53	1.89	1.88

*Exclusive of Six Counties.

that for comparability with the past Nos. 140-205 (excluding Nos. 201 (Hodgkin's Disease) and 204 (Leukaemia and Aleukaemia)) should also be shown.

In 1950 there were 4,213 deaths from Malignant Neoplasms (Nos. 140-199) and from Neoplasms of Lymphatic and Haematopoietic Tissues (Nos. 200-205). Of this number 37 deaths were caused by Hodgkin's Disease and 77 by Leukaemia and Aleukaemia.

Table XXV shows the death rate from Cancer in Ireland and neighbouring countries since 1938.

The general increase in the Cancer death rate in each area since 1938 will be noted. The rate in Ireland (exclusive of the Six Counties) is the lowest, but this fact can be attributed to some extent at least to the high proportion of uncertified deaths at the older ages in this country. Most of these deaths are described as due to senility and it is almost certain that a considerable proportion of them is caused by Cancer. The figures should be accepted with caution as it is not certain that they are comparable over time and between the different areas.

Table XXVI shows the death rate from Cancer in certain age groups in 1925-27, 1935-37, 1945-47 and 1948-50.

TABLE XXVI

DEATHS FROM CANCER IN CERTAIN AGE GROUPS PER 1,000 CORRESPONDING
POPULATION, 1925-27, 1935-37, 1945-47 AND 1948-50

Age Groups	1925-27	1935-37	1945-47	1948-50
Under 25 ...	0.02	0.02	0.03	0.03
25-34 ...	0.13	0.12	0.14	0.14
35-44 ...	0.63	0.56	0.54	0.54
45-54 ...	1.85	1.88	1.66	1.63
55-64 ...	3.82	4.10	3.81	3.69
65-74 ...	4.64	5.99	6.90	6.78
75 and over ...	3.85	4.94	7.27	8.97
Crude Rate : All ages ...	1.00	1.21	1.35	1.38
Standardised* Rate : All ages	1.09	1.24	1.35	1.38

*Standardised to the 1946 population.

It will be observed that the death rate at ages 35-64 years has decreased since 1935-37 while at ages over 65 years there has been an increase, particularly at ages over 75 years. Between 1925-27 and 1948-50 the crude death rate for all ages increased by 38 per cent. while the standardised rate increased by 27 per cent. The greater part of the increases, therefore, is not due to the ageing of the population. It may be ascribed to greater preciseness in certifying deaths and to a reduction in the number of uncertified deaths, as well as to any increase in the incidence of Cancer.

Table XXVII shows deaths from Malignant Neoplasms classified by site of disease and from Neoplasms of Lymphatic and Haematopoietic Tissues in certain age groups.

TABLE XXVII.

There were 2,243 deaths of males and 1,970 deaths of females in 1950. For each sex the site of the malignant neoplasm for more than half these deaths was in the Digestive organs and Peritoneum. Cancer of the Stomach and Small Intestine caused 553 deaths of males and 461 deaths of females. There were 588 deaths of females from Cancer of the Breast and Genital System; there were 248 deaths of males. The difference between the sexes in this group is due to the large number of deaths of females from Cancer of the Breast, while male deaths from Cancer of the Breast are very few in number. Cancer of the Buccal Cavity and Pharynx is relatively more

*Standardised to the 1946 total population.

serious among males than among females. There were 208 deaths of males in this group and only 52 deaths of females. The number of deaths from Cancer of the Respiratory System is also far greater for males than for females.

Table XXVIII shows deaths from malignant neoplasms classified by site and from neoplasms of lymphatic and haematopoietic tissues, in certain age groups, per 100,000 population.

The death rate per 100,000 population in each age group is shown for the main groups of sites, and it will be observed that there is in general a rapid rise in death rate with increasing age. Cancer of the Respiratory System, however, is an exception,

Donegal	8.32	22.7
Monaghan	6.85	10.6
ULSTER (part of)	8.23	18.3
TOTAL	8.97	11.3

the largest death rate occurring at ages 55-64 years for males and at ages 65-74 years for females. The death rate for Neoplasms of Lymphatic and Haematopoietic Tissues also decreases at the very old ages.

Table XXIX shows the death rate from Malignant Neoplasms in certain age groups for each county and county borough in 1950.

Standardised rates which eliminate the effect of differences arising from the different age distributions of the populations are shown in the last column. It will be observed that standardisation has a marked effect on the rates in certain counties. The standardised rates are highest in Dublin County Borough (1.78), Dún Laoghaire Borough (1.89), Dublin County (1.67) and Waterford County Borough (1.83). The lowest rates occur in Kilkenny (1.09), Laoighis (1.06), Leitrim (0.71), Mayo (1.06), Donegal (1.04) and Monaghan (1.04). The low rates in some counties can be attributed to the registration of large numbers of uncertified deaths in these counties, most of which are returned as being due to Senility. If these deaths had been certified by medical practitioners, it is probable that a large number of them would have been returned as caused by Cancer.

The death rate varies from 0.03 per thousand population at ages under 25 years to 9.23 per thousand population at ages 75 years and over. In the oldest age group the rate varies from 20.25 in Dún Laoghaire Borough to 5.01 per thousand population in Roscommon. In several counties there is a decline in the death rate at ages 75 years and over compared with the preceding age group. This is probably due to causes already mentioned.

Table XXX compares the mortality rate from Cancer at ages 75 years and over with the percentage of uncertified deaths in each county.

It will be observed that the Cancer rates are low in general in Connacht and Ulster while the percentages of uncertified deaths are high. On the other hand the Cancer rates are high in the county boroughs and in the non-urbanised counties of Leinster and Munster and, correspondingly, the percentages of uncertified deaths are lower. There is in general, therefore, a relationship between mortality from Cancer at the old ages and the percentages of deaths uncertified.

Heart Diseases

As already observed from Table XVIII Diseases of the Heart caused 277 in every thousand deaths in 1950. There were in all 10,463 deaths from Diseases of the Heart (Nos. 410-434 of the International List). Of these 1,906 deaths were caused by Arterio Sclerotic Heart Diseases including Coronary Disease. 1,030 were caused by Chronic Endocarditis not specified as Rheumatic, and 6,063 by Other Myocardial Degeneration. There were 145 deaths from Chronic Rheumatic Heart Disease and 1,319 deaths from Other Diseases of the Heart.

Respiratory Diseases

Deaths from Respiratory Diseases in 1950 numbered 2,856. These include 325 deaths caused by Influenza, 1,171 by Pneumonia, 993 by Bronchitis, 367 by Other Respiratory Diseases. For comparative purposes it should be observed that Influenza was classified as an infective disease prior to 1950.

Pregnancy, Childbirth and the Puerperium

Table XXXI shows the number of deaths from Deliveries and Complications of Pregnancy, Childbirth and the Puerperium. The classification is according to the Fifth Revision of the International List,

TABLE XXXI.

DEATHS FROM DELIVERIES AND COMPLICATIONS OF PREGNANCY, CHILDBIRTH AND THE PUERPERIUM, 1938—1950.

Cause of Death	1938	1939	1940	1941	1942	1943	1944	1945	1946	1947	1948	1949	1950

TOTAL ...	234	190	208	182	163	145	156	159	137	130	104	116	99
Rate per 1,000 births ...	4.11	3.39	3.67	3.21	2.47	2.25	2.38	2.37	2.01	1.88	1.58	1.81	1.56

Between 1938 and 1950 there was a decline in the number of deaths from these causes from 234 to 99. In the same period the mortality rate declined from 4.11 to 1.56 per thousand births. The most striking reduction in the number of deaths occurred in the groups Infection during Childbirth and Puerperal Toxaemias. From these causes there were 90 deaths in 1938 and only 20 in 1950.

Table XXXII shows the deaths in 1950 classified according to the Sixth Revision of the International Classification and by age of mother.

TABLE XXXII

DEATHS OF WOMEN IN 1950 CAUSED BY PREGNANCY, CHILDBIRTH AND THE PUERPERAL STATE
CLASSIFIED BY PRINCIPAL CAUSES AND BY AGE GROUPS.

Causes of death	All Ages	Ages						
		15-19	20-24	25-29	30-34	35-39	40-44	45 years and upwards
Toxaemias of pregnancy ...	16	.	2	2	5	6	1	.
Placenta praevia and other haemorrhage of pregnancy	7	.	1	1	2	2	1	.
Other complications of preg- nancy ...	5	.	.	2	.	2	1	.
Abortion with sepsis ...	1	.	.	.	.	.	1	.
Other abortion ...	1	.	.	.	.	.	1	.
Haemorrhage of childbirth	24	.	2	3	3	13	3	.
Delivery complicated by re- tained placenta ...	7	.	.	2	1	1	3	.
Other complications at child- birth ...	18	.	3	2	2	8	2	1
Puerperal pulmonary embo- lism ...	8	1	1	1	2	2	1	.
Sepsis of childbirth and the puerperium ...	4	.	.	1	2	1	.	.
Other puerperal complica- tions ...	8	.	.	2	2	2	1	1
TOTAL ...	99	1	9	16	19	37	15	2

It will be seen that 37 of the 99 deaths occurred at ages 35-39 years, 19 at ages 30-34 years, 16 at 25-29 years and 15 at ages 40-44 years. Since births are not classified by age of mother, it is not possible to work out death rates for each age group of mother.

Accidents, Poisonings and Violence

Table XXXIII shows the number of deaths from external causes classified by cause for each year since 1938.

TABLE XXXIII.

Deaths from accidents, poisoning, violence, etc., 1938—1950.

Cause of Death	1938	1939	* 1940	1941	1942	1943	1944	1945	1946	1947	1948	1949	1950

TOTAL ...	957	910	1,067	953	999	961	901	878	880	971	922	979	905

*The deaths in 1950 are classified according to the Sixth Revision of the International List. On the basis of this List a number of deaths are now attributed to falls, which would have been attributed to "Other accidents" on the basis of the Fifth Revision.

The total number of deaths from external causes in 1950 was 905. Deaths from road transport accidents numbered 200 in 1950 compared with 209 in 1949. This number is about equal to those of the years 1938 and 1939. The large decline in the number of deaths from road transport accidents for 1943-46 will be observed. In 1950 there were 106 deaths from accidents caused by fire, explosion or burns, and 101 deaths from accidental drownings. Railway accidents caused 14 deaths and poisonings accounted for 15 deaths. There were 76 suicides and 393 deaths were caused by falls and other accidents and external causes.

Of the 200 deaths in road transport accidents 139 were motor vehicle transport accidents. These are classified by type of accident and by age of deceased in Table XXXIV.

TABLE XXXIV

MOTOR VEHICLE TRANSPORT ACCIDENTS, 1950—BY SEX AND BY AGE

Cause of Death			Total	Under 15 years	15-24	25-34	35-44	45-54	55-64	65+
Motor vehicle traffic accident to pedestrian	M		71	22	7	4	6	7	6	19
	F		15	7	2	1	1	1	1	2
Motor vehicle traffic accident to pedal cyclist	M		10	2	2	1	—	1	2	2
	F		3	1	1	—	—	1	—	—
Motor vehicle traffic accident to rider or passenger of motor- cycle	M		4	—	1	1	2	—	—	—
	F		—	—	—	—	—	—	—	—
Other motor vehicle traffic accident in- volving two or more vehicles ...	M		7	—	2	2	1	1	1	—
	F		1	1	—	—	—	—	—	—
Other motor vehicle traffic accidents ...	M		20	1	4	6	3	4	2	—
	F		8	—	4	3	—	1	—	—
TOTAL ...	M		112	25	16	14	12	13	11	21
	F		27	9	7	4	1	3	1	2

There were 86 deaths of pedestrians and 29 of these were at ages under 15 years and a further 21 at ages 65 years and over. There were 13 deaths of pedal cyclists and 4 deaths of persons on motor cycles. There were 36 deaths caused by other or unspecified motor vehicle traffic accidents. It will be observed that the number of males who died from such accidents was about four times as great as the number of females.

Infant Mortality

During the year 1950 the deaths of 2,922 infants under 1 year were registered compared with 3,415 in the preceding year. The figure for 1950 is equivalent to a rate of 46 per 1,000 live births registered which is the lowest definitive rate yet recorded. The infant mortality rate has fallen considerably since the beginning of the century as Table XXXV indicates.

TABLE XXXV

INFANT MORTALITY RATES IN IRELAND AND NEIGHBOURING COUNTRIES,
1901-1950

Period	Deaths of infants under 1 year per 1,000 live births			
	Ireland*	Six Counties	England and Wales	Scotland
1901-10 ...	91	107	128	116
1911-20 ...	84	99	100	106
1921-30 ...	70	81	72	89
1931-40 ...	68	78	59	78
1941-50 ...	66	60	43	57
1941 ...	74	77	60	83
1942 ...	69	76	51	69
1943 ...	83	78	49	65
1944 ...	79	67	45	65
1945 ...	71	68	46	56
1946 ...	65	54	43	54
1947 ...	68	53	41	56
1948 ...	50	46	34	45
1949 ...	53	45	32	41
1950 ...	46	40	30	39

* Exclusive of the Six Counties.

The rate in 1950 was approximately half that in the period 1901-1910. The proportionate decline, however, has not been as marked as in neighbouring countries. In England and Wales the 1950 rate of 30 per thousand births is less than one-quarter the rate in 1901-10 and in Scotland the 1950 rate is about one-third the 1901-10 rate. The Irish rates for the decades 1901-10, 1920-21 and 1921-30 were the lowest for any of the four areas shown. In 1901-10 the rate in England and Wales was 41 per cent. higher than the Irish rate, that in Scotland 27 per cent. higher and that in the Six Counties 18 per cent. higher. In the decade 1941-50 on the other hand the Irish infant mortality rate exceeded that of the other three areas. In that decade the average rate for England and Wales was 35 per cent. lower than the Irish rate, the Scottish rate was 14 per cent. lower and the Six County rate 9 per cent. lower. A substantial fall in the Irish rate from the level which prevailed since about 1920 was recorded in 1948 and while a further decline occurred in 1950 it appears that a considerable improvement in this mortality index can still be effected.

Table XXXVI shows the rate of mortality at different ages under 1 year for individual years since 1938 and the percentage of the total infant mortality in each age group.

The infant mortality rate rose during the years 1938-43 reaching a peak of 82.6 in 1943, as compared with 66.6 in 1938. It declined subsequently reaching 67.9 in 1947. In 1948 it fell substantially to 50.2 and, following a recession in 1949 to 53.2, reached 46.0 in 1950. Both the deterioration in the rate in 1938-1943 and the subsequent improvement affected mainly deaths of infants between one month and one year of age. The neo-natal mortality which was 28.3 per 1,000 births in 1938, rose to 33.2 in 1943 and fell to 23.1 in 1950. Thus the 1943 neo-natal mortality rate was 17 per

INFANT AND NEO-NATAL MORTALITY, 1938 - 1950

* For 1950, under 4 weeks.

cent. higher than in 1938 and the 1950 rate was 18 per cent. below the 1938 level. On the other hand the deaths of infants between one month and one year of age increased from 38.3 per 1,000 births in 1938 to 49.4 in 1943 (a rise of 29 per cent.), and fell to 22.9 in 1950, a rate which was 40 per cent. below the 1938 level. There was comparatively little change between 1938 and 1950 in rates for deaths under 7 days, the corresponding figures per 1,000 births being 16.7 in 1938 and 15.6 in 1950. All subsequent age classifications showed substantial reductions when 1938 is compared with 1950.

Table XXXVII shows the total infant mortality rate and neo-natal rate classified by sex in each year since 1938.

TABLE XXXVII
INFANT MORTALITY AND NEO-NATAL MORTALITY BY SEX, 1938-1950.

Year	Neo-natal Mortality Rate		Infant Mortality Rate	
	Male	Female	Male	Female
1938 ...	30	26	73	60
1939 ...	32	26	73	58
1940 ...	30	26	72	60
1941 ...	34	26	83	64
1942 ...	31	24	78	60
1943 ...	37	29	92	72
1944 ...	37	29	88	71
1945 ...	35	28	78	64
1946 ...	32	26	71	58
1947 ...	32	26	75	60
1948 ...	25	21	54	46
1949 ...	28	22	59	48
1950 ...	26	20	51	41

The male rates are consistently higher than the female rates. In 1950 there were 51 deaths per 1,000 male births registered and 41 deaths per 1,000 female births registered. At under 4 weeks of age there were 26 deaths per 1,000 male births and 20 deaths per 1,000 female births.

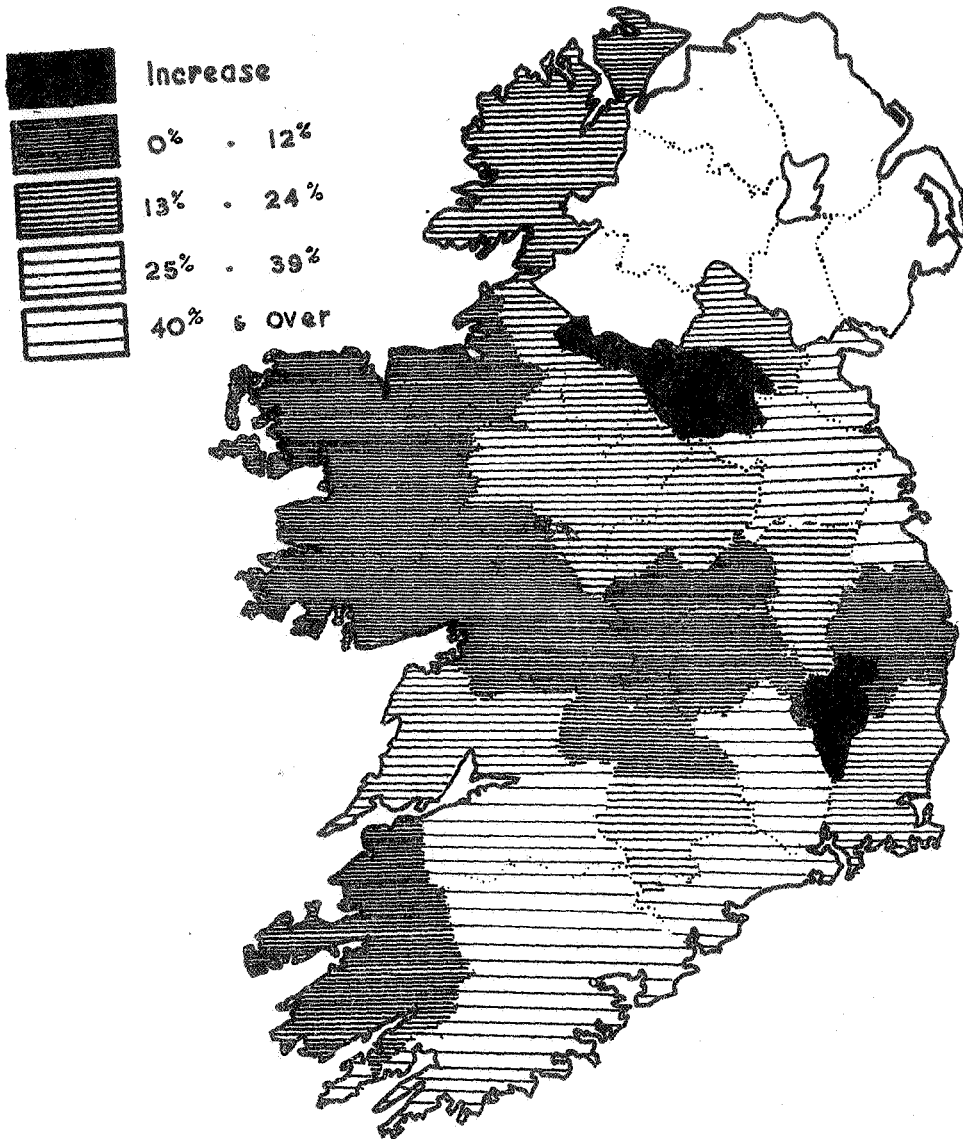

Table XXXVIII shows the infant mortality rates in each county and county borough in 1925-27, 1935-37, 1945-47, 1948-50.

TABLE XXXVIII

While there was little change in the infant mortality rate in the whole country between 1925-27 when it was 71, and 1945-47 when the rate was 68 per 1,000 births, considerable changes were recorded in some areas. The most marked declines recorded were those in the County Boroughs and substantial decreases were also shown in Counties Dublin, Kilkenny, Louth and Tipperary S.R., while relatively large increases were recorded in Counties Laoighis, Longford, Offaly, Wicklow, Tipperary N.R., Sligo and Cavan. The changes in the rates in the other counties were less noticeable. There

Percentage decline in Infant Mortality between 1925-27 and 1948 - 50.

Infant Mortality (Deaths of Infants under 1 year of age per 1,000 births) 1950.

was a considerable decline in the infant mortality rates in 1948-50—to 50 per 1,000 births compared with 68 in 1945-47 and this was fairly general throughout the country. The last column of figures in Table XXXVIII shows the percentage decline in the rate for each county and county borough between 1925-27 and 1948-50. The largest percentage declines in mortality occurred in Dublin County and County Borough, Limerick County Borough, Waterford County Borough which areas, however, had the largest rates in 1925-27. Declines of 20 per cent. or over were also recorded in Kildare, Kilkenny, Louth, Meath, Cork County and County Borough, Tipperary S.R. and Monaghan. The decrease was less than 10 per cent. in Laoighis, Offaly, Wicklow, Kerry, Tipperary N.R. and Galway, while in two counties, Carlow and Cavan, there were increases in the rate.

In 1925-27 the lowest rate was 42 in Roscommon and the highest 118 in Dublin County Borough, while in 1948-50 the lowest was 35 in Roscommon and the highest 63 in Limerick County. It is evident, therefore, that the reduction in the infant mortality rate in recent years has tended to make the rates in different areas in the country more uniform.

It may be inferred from Table XXXVIII that there is a correlation between degree of urbanisation and the percentage decline in infant mortality as is clearly shown in Table XXXIX.

TABLE XXXIX
INFANT MORTALITY IN URBAN AND RURAL DISTRICTS

Area	1925-1927	1935-1937	1945-1947	1948-1950	Percentage decline 1925-27 to 1945-47
Total ...	71	72	68	50	% 30
Dublin Co. Boro' and Dún Laoghaire Boro'	116	102	95	53	54
Other Co. Boroughs	99	91	77	59	41
Other Principal Towns	85	75	68	55	35
Other Urban Districts	77	75	68	56	27
Rural Districts ...	55	59	58	47	15

The decline between 1925-27 and 1948-50 in Dublin County Borough and Dún Laoghaire Borough is 54 per cent. compared with 41 per cent. in the other County Boroughs, 35 per cent. in the other principal towns, 27 per cent. in the other urban districts and 15 per cent. in rural districts.

An analysis of the causes of death of infants under 1 year of age in 1950 showing the age at death is contained in Table XL.

Among the Infective and Parasitic Diseases, Whooping Cough accounted for 42 deaths, Tuberculosis of Meninges and Central Nervous System for 30 deaths and Measles for 17 deaths. Influenza caused 35 deaths and Bronchitis 54 deaths. There were 120 deaths from Convulsions and 30 from Meningitis. Pneumonia caused 424 deaths and Diarrhoea and Enteritis caused 247 deaths. There were 316 deaths from Congenital Malformations. Among the diseases of Early Infancy Premature Birth accounted for 468 deaths and Injury at Birth for 149 deaths. There were 739 deaths caused by Other Diseases of Early Infancy (including Congenital Debility) of which 480 were assigned to code number 773—Ill-defined Diseases peculiar to Early Infancy. Mechanical suffocation and other accidents caused 47 deaths.

Table XLI shows the deaths of infants under 1 year of age per 1,000 births registered classified by cause of death for each year since 1938.

The most notable facts revealed by this table are the large declines in the death rate from Diarrhoea and Enteritis and from Congenital Debility since 1943. Care must be exercised in any comparison between the figures for 1950 and those for earlier years, because the 1950 classification is according to the Sixth Revision of the International List of Diseases, Injuries and Causes of Death, whereas the classification for the earlier years is according to the Fifth Revision of this List. To facilitate comparisons the International List numbers are shown in the table for both the 5th and 6th Revisions. The increase shown in 1949 and 1950 for Congenital and other diseases peculiar to first year of life and the corresponding decrease in premature births is due to the allocation in 1950 of a proportion of the deaths to the first mentioned group which would be assigned to premature births in the Fifth Revision of the International List. The effect of the changes in classification to which reference has already been made may be followed in Table 27.

Table XLII shows the deaths of infants under 1 year in 1950 classified by cause of death for groups of towns.

The death rates in the different causes do not vary significantly, the only point of note being that the death rate from Diarrhoea and Enteritis in Cork, Limerick and Waterford County Boroughs is higher than elsewhere, while the death rate from other Diseases peculiar to the first year of life is somewhat lower.

In 1950 there were 127 deaths of illegitimate infants under 1 year of age. The death rate for these infants was 78 per 1,000 illegitimate births, as compared with 45 for children born in wedlock. Table 23 shows deaths of illegitimate children under 1 year of age classified by cause of death and age.

Deaths in Institutions

The following table shows the numbers and percentages of deaths in institutions since the beginning of the century.

The figures show there is a gradual tendency for the proportion of deaths in institutions to increase. In 1901–1910, 78·2 per cent. of deaths occurred at home and the proportion had fallen to 65·2 per cent. by 1941–50. In 1950 the proportion was down to 62·6 per cent. The proportion of deaths occurring in general and special hospitals increased from 4·7 per cent. in 1901 to 12·6 per cent. in 1941–50. In the last 10 years, however, there has been no significant tendency in this proportion. About 3 per cent. of deaths occur in mental hospitals and this proportion has not changed much since the beginning of the century. The percentage of deaths in county homes increased from 15·0 per cent. in 1901 to 19·4 per cent. in 1941–50. In 1950 the figure was 22·1 per cent.

Table XLIV shows the percentage of deaths which occurred in institutions for each county and county borough in 1950.

TABLE XLIV
PERCENTAGE OF DEATHS IN INSTITUTIONS IN EACH COUNTY AND COUNTY BOROUGH, 1950

County	Percentage in Institu- tions	County	Percentage in Institu- tions	County	Percentage in Institu- tions
TOTAL	37.4	Wexford	32.4	Galway	33.7
Carlow	31.7	Wicklow	34.5	Leitrim	23.1
Dublin Co. (remainder)	44.3	LEINSTER	43.3	Mayo	24.3
Dublin Co. Boro' ...	53.6	Clare	32.7	Roscommon ...	30.6
Dún Laoghaire Boro'	43.9	Cork Co.	37.5	Sligo	28.5
Kildare	39.4	Cork Co. Boro' ...	54.2	CONNACHT	28.7
Kilkenny	36.1	Kerry	34.8	Cavan	31.7
Laoighis	36.4	Limerick Co. ...	31.3	Donegal	19.1
Longford	36.3	Limerick Co. Boro'	42.6	Monaghan	31.4
Louth	42.8	Tipperary N.R. ...	31.7	ULSTER (part of)	25.4
Meath	35.6	Tipperary S.R. ...	38.7		
Offaly	32.8	Waterford Co. ...	36.4		
Westmeath	39.0	Waterford Co. Boro'	44.9		
		MUNSTER	37.6		

The proportion varies from 19·1 per cent. in Donegal to 53·6 per cent. for Dublin County Borough and 54·2 per cent. for Cork County Borough. Besides Donegal the following counties have low percentages—Leitrim (23·1 per cent.), Mayo (24·3 per cent.) and Sligo (28·5 per cent.). Counties or county boroughs having more than 40 per cent. deaths in institutions (besides Dublin and Cork Co. Boroughs) are Waterford County Borough (44·9 per cent.), Dublin County (44·3 per cent.), Dún Laoghaire Borough (43·9 per cent.), Louth (42·8 per cent.) and Limerick County Borough (42·6 per cent.).

Uncertified Deaths

Table XLV shows the percentage of deaths uncertified in each county and county borough in 1925-27, 1935-37, 1945-47 and 1948-50.

ULSTER (part of)	37·7	28·5	21·7	18·3

Between 1925-27 and 1948-50 the percentage of uncertified deaths fell from 25·7 to 11·3. The decline was spread through the country but was proportionately greater in some counties than in others. In nearly all counties the 1948-50 figures are less than half those of 1925-27. The exceptions are Clare, Kerry, Galway, Leitrim, Mayo, Roscommon, Donegal, Dublin County Borough. In Dublin County Borough, however, although the proportion increased slightly it was very small in 1948-50 being only 1·4 per cent. The counties having the highest percentages in 1948-50 are Leitrim (29·7 per cent.), Roscommon (28·4 per cent.), Mayo (27·6 per cent.), Galway (22·9 per cent.), Donegal (22·7 per cent.), Kerry (21·6 per cent.) and Longford (20·8 per cent.). The lowest figures are in Cork County Borough (0·1 per cent.), Waterford County Borough (0·2 per cent.), Dublin County (0·3 per cent.), Limerick County Borough (1·1 per cent.), Dublin County Borough (1·4 per cent.).

Table XLVI shows the percentage of deaths uncertified in certain cause groups for each county and county borough in 1950.

Donegal ...	21.4	39.9	35.6	2.1	1.0	100
Monaghan ...	16.3	30.7	49.1	2.3	1.6	100
TOTAL ...	37.5	30.8	27.7	2.5	1.5	100

It will be observed that 57.1 per cent. of deaths due to senility without mention of psychosis were uncertified in 1950 and 47.5 per cent. of deaths due to ill-defined and unknown causes. The proportions uncertified for the various causes in the different counties varied widely. More than 75 per cent. of deaths from senility were uncertified in Counties Longford, Kerry, Galway, Roscommon and Sligo, while in Dublin County Borough and Dublin County (exclusive of Dún Laoghaire Borough) the proportion was only 4.4 per cent. In Cork County Borough the proportion was 3.2 per cent. In Waterford County Borough and Dún Laoghaire Borough there were no uncertified deaths. There were 12.9 per cent. uncertified deaths among influenza deaths. The proportion varied from nil in certain counties to 81.8 per cent. in Longford. Among Heart Diseases 3.3 per cent. of the deaths were uncertified but the proportion exceeded 10 per cent. in two counties, viz., Leitrim, where it was 10.8 per cent. and Donegal where it was 10.7 per cent. In the group Vascular Lesions affecting the Central Nervous System there were 4.3 per cent. uncertified deaths, the proportion, however, exceeding 10 per cent. in several counties. These were Longford (13.0 per cent.), Leitrim (11.9 per cent.), Sligo (12.2 per cent.) and Donegal (22.1 per cent.).

In the Western counties, therefore, apart from the very high proportion of deaths attributed to senility and ill-defined causes which are uncertified, a considerable proportion of deaths which have been assigned to well-defined causes are also uncertified. It would seem probable that if the deaths allocated to the groups senility and ill-defined and unknown causes were certified by medical practitioners, it would be found that they would be assigned to well-defined causes such as Malignant Neoplasms or Heart Diseases.

Inquests and Post Mortems

The number of deaths registered on certificates issued by coroners as the result of inquests or post-mortem examinations during the year 1950 was 1,340.

Interval between Death and Registration

The legal position with regard to registration of deaths is that registration should take place within 5 days of the date of death, but this period may be extended to 14 days if the registrar receives within 5 days a notice that the death has taken place, accompanied by the medical certificate of cause of death. If the death has not been registered within 14 days, the registrar may send a requisition to a person bound to give him information to attend and register the death. If the death has not been registered within 1 year, it may only be registered with the authority of the Registrar-General. Table XLVII shows the percentages of deaths registered in each county in certain intervals within 1 year from the date death has occurred.

Only 37.5 per cent. of deaths in 1950 were registered within 5 days of the date of death and only a further 30.8 per cent. in the period 6-14 days after death. From 15 days to 3 months after death 27.7 per cent. were registered and 4.0 per cent. were registered after 3 months. The promptness of registration varies considerably throughout the country. In Dublin County Borough over three-quarters of the deaths were registered within 5 days and about three-fifths were registered in the same period in Dublin County. The next best areas for numbers registered within 5 days are Waterford County Borough (57.1 per cent.), Cork County Borough (48.6 per cent.), and Louth (40.4 per cent.). The counties with the lowest proportions registered within 5 days are Leitrim (13.2 per cent.), Mayo (15.0 per cent.), Galway (15.4 per cent.), Cavan (15.8 per cent.), Monaghan (16.3 per cent.), Longford (16.8 per cent.), Sligo (18.0 per cent.).

The proportion of deaths registered from 6 to 14 days after death varied from 16.2 per cent. in Dublin County Borough to 41.1 per cent. in Limerick County Borough. In the following counties the proportion of deaths registered from 15 days to 3 months after death exceeded 40 per cent. :—Mayo (49.3 per cent.), Monaghan (49.1 per cent.), Leitrim (47.7 per cent.), Galway (44.4 per cent.), Longford (42.9 per cent.), Clare (42.4 per cent.), Cavan (42.3 per cent.), Sligo (41.3 per cent.). The counties which have the highest proportions registered after 3 months are Galway (10.3 per cent.), Leitrim (9.2 per cent.), and Mayo (8.6 per cent.).

The large time interval which elapses between date of death and date of registration for a high proportion of deaths and the fact that the counties are not uniform in this respect renders almost useless the seasonal comparison of death rates in this country. Even in Dublin County Borough there is room for considerable improvement, while the lateness of registration in the other areas is deplorable.
