REPORT ON VITAL STATISTICS FOR THE YEAR 1956.

THIS Report has been prepared by the Central Statistics Office for the Minister for Health in accordance with the provisions of Section 2 of the Vital Statistics and Births, Deaths and Marriages Registration Act, 1952. It follows closely the form of the Reports of the Ard-Chláraitheoir for earlier years.

The statistics in this Report relate to the area in Ireland exclusive of the Six Counties.

In this Report births have been assigned to the district containing the normal residence of the parents, and deaths to the district containing the normal residence of the deceased. The number of births shown for each of the years 1943 to 1956 is exclusive of late registrations, and the number of deaths for each of the years 1940 to 1956 is exclusive of non-residents.

The important statistics contained in this Report have already been published, and the Report consists mainly of a breakdown and analysis of these statistics.

GENERAL SUMMARY

Marriages—There were 16,761 marriages registered during the year 1956 compared with 16,443 in 1955. The marriage rate per 1,000 population was 5·8, this being the highest rate recorded since 1946.

Births—The number of births registered during 1956 was 60,740 and the birth rate was 21·0 per 1,000 population, compared with 21·1 per 1,000 population in 1955. The number of illegitimate births registered in 1956 was 1,173 or 1·9 per cent of all births.

Deaths—The number of deaths registered during 1956 was 33,910 and the death rate was 11·7 per 1,000 population.

Of the deaths registered in 1956, 30·1 per cent was stated to be due to heart diseases, 13·5 per cent to malignant neoplasms, 10·7 per cent to vascular lesions affecting the central nervous system and 2·0 per cent to tuberculosis (all forms).

The number of deaths from tuberculosis of all forms was 689 and the rate was 0·24 per 1,000 population. This is the lowest rate recorded up to 1956. There has been a considerable decline in the death rate from tuberculosis since 1947, when it was 1·24 per 1,000 population.

There were 4,407 deaths from malignant neoplasms and neoplasms of lymphatic and haematopoietic tissues (excluding Hodgkin's disease and leukaemia and aleukaemia). This total is comparable with that for "cancer" in the 1949 and earlier Reports. The rate in 1956 was 1·52 per 1,000 population compared with 1·55 in 1955.

During 1956 the deaths of 2,162 infants under one year were registered, equivalent to a rate of 36 per 1,000 live births. This is the lowest rate recorded up to 1956.

The total number of deaths from accidents and other external causes in 1956 was 1,016 of which road vehicle accidents accounted for 256.

Marriage, birth and death rates per 1,000 population for the years 1938 to 1956 are illustrated in Diagram I.

Issue of Authority for Registration—Births and deaths which have not been registered within one year of their occurrence can only be registered on the authority of the Ard-Chláraitheoir. The number of births registered on the authority of the Ard-Chláraitheoir in 1956 was 1,064 and the number of deaths registered was 112. Throughout the tables in this Report these births and deaths have been excluded.

Population—The population at the 9th April, 1956, was 2,898,264.

Diagram 1.
BIRTH, MARRIAGE AND DEATH RATES. (PER 1,000 POPULATION) 1938-1956.

MARRIAGES

There were 16,761 marriages registered in 1956, an increase of 318 on the previous year, and the highest number of marriages registered in any year since 1946. The marriage rate, at 5·8 per 1,000 population in 1956, compared with a rate of 5·6 in 1955 and 5·4 in each of the years 1948 to 1954. Tables 4 and 5 of this Report show the average numbers of marriages registered and marriage rates for ten year periods since 1864 and by single years since 1941, while Table 6 shows marriages classified by quarter of registration and religious denomination for each year since 1943. The following table compares the marriage rates in Ireland in the years 1951 to 1956 with those in the Six Counties, England and Wales and Scotland :

TABLE I

NUMBER OF MARRIAGES PER 1,000 POPULATION IN IRELAND* AND NEIGHBOURING COUNTRIES, 1951-1956

Years	Ireland*	Six Counties	England and Wales	Scotland
1951	5·4	6·8	8·2	8·1
1952	5·4	6·8	8·0	8·0
1953	5·4	6·8	7·8	8·0
1954	5·4	6·6	7·7	8·2
1955	5·6	6·8	8·1	8·4
1956	5·8	6·7	7·9	8·5

*Exclusive of the Six Counties

The marriage rate in this country is lower than that in the Six Counties which is, in turn, low by comparison with the rates for England and Wales and Scotland.

Mode of Celebration

The number of marriages celebrated in accordance with the rites and ceremonies of the Catholic Church registered in 1956 amounted to 16,041 (equal to 95·7 per cent of the total) and other marriages numbered 720. In the year 1956 the number of marriages other than Catholic recorded included 483 according to the rites and ceremonies of the Protestant Episcopal Church, 95 in Presbyterian Meeting Houses, 51 in registered buildings belonging to various other religious denominations, 75 by civil contract in the Registrars' Offices, 4 according to the usage of the Society of Friends and 12 according to Jewish rites.

The most recent Census of Population at which particulars of religious denomination were asked was that of 1946. At that time Catholics represented 94·3 per cent of the population, Protestant Episcopalians 4·2 per cent, Presbyterians 0·8 per cent, Methodists 0·3 per cent and other denominations 0·4 per cent.

The number of Catholic marriages recorded during 1956 corresponds to a rate of 5·87 per 1,000 of the estimated Catholic population, this being 0·21 above the rate for the preceding year. The rate for all other marriages in 1956 was 4·36 per 1,000 of all persons other than Catholics in the population, a decrease of 0·76 on the corresponding rate for 1955. Details of marriages registered in each of the years 1951 to 1956 are given in Table II.

Marriage rates by counties and provinces

Marriage rates in the counties, county boroughs and provinces are shown in Table 12. In making comparisons between different areas it must be remembered that the rates are based on the total number of marriages registered in each area, irrespective of the fact that the persons married may not be residents of the areas in which the marriages took place. An examination of the returns of marriages shows that many persons living in the rural portions of the country are married in the county boroughs or other urban areas. This fact accounts in some measure for the high rates in the county boroughs. In 1956 the rates per 1,000 population in the County Boroughs were Cork 12·14, Dublin 10·17, Limerick 8·78 and Waterford 5·99. For Dun Laoghaire Borough the rate was 9·0. The lowest rates were in the Counties of Roscommon 3·28, Dublin 3·48, Leitrim 3·51, Laois 3·55 and Mayo 3·62.

Age at marriage

In 1956 and earlier years the law did not require that the ages of the contracting parties should be entered in the marriage register or certificate. It was necessary only that each party should be described as of full age or minor, as the case might be. Thus a record of the ages of persons marrying is not available.

Particulars of marriages of minors (i.e., persons under 21 years of age) for the years 1951 to 1956 are given in Table III.

TABLE III
MARRIAGES OF MINORS, 1951-1956

BIRTHS

Under a new system for the collection of statistics of births introduced in 1955 a considerable volume of information dealing with such matters as age of mother at maternity, parity of birth and duration of marriage has become available. These statistics in respect of births registered in 1956 are presented in TABLES 32 to 38.

The number of births registered during the year 1956 was 60,740, the males numbering 31,257 and the females 29,483. Births registered in 1955 numbered 61,622 and in 1954, 62,534. The birth rate in 1956 was 21·0 per thousand population, compared with 21·1 in 1955 and 21·3 in 1954.

Table IV compares the birth rates in Ireland in the years 1951 to 1956 with those in the Six Counties, England and Wales and Scotland.

TABLE IV
NUMBERS OF BIRTHS IN IRELAND* AND BIRTH RATES PER 1,000 POPULATION IN IRELAND* AND NEIGHBOURING COUNTRIES, 1951-1956

1955	61·6	21·1	20·8	15·0	18·0
1956	60·7	21·0	21·1	15·6	18·5

* Exclusive of the Six Counties

In each country the birth rate reached a very high level in the war and immediate post-war years, and subsequently tended to decline. In this country the post-war decline in the birth rate, which was less pronounced than in the neighbouring countries, continued up to 1956. In the Six Counties, England and Wales and Scotland the birth rate in 1956 was above the rate in 1955, the increase being fairly substantial in the cases of England and Wales and Scotland. The birth rate in this country in 1956 was slightly below that in the Six Counties for the first time since the year 1947.

Classification by age at maternity, parity and duration of marriage

In TABLE 34 is shown the total number of births registered in 1956, classified by age of mother at maternity and number of previous live-born children. The number of births in the case of which the mother's age was not stated was 403, or 0·7 per cent of the total, and the number where the parity was not stated was 424 or 0·7 per cent of the total. As 1955 was the first year in which this information was sought, the relatively low proportion of cases "not stated" is fairly satisfactory. The results contained in TABLE 34 are summarised in Table V.

In preparing this table the procedure in the case of multiple births was to count each child as an individual birth. For instance if a fifth pregnancy produced twins the children would be classified as a fifth and sixth child in parity order.

There was little change from 1955 to 1956 in the distribution of births according to age of mother at maternity, as may be seen from Table VI, in the calculation of which only those births where the age was stated are, of course, included. This table also illustrates the striking difference between this country and England and Wales and Scotland in respect of the distribution of mothers at maternity.

The difference between this country and England, Wales and Scotland shown by Table VI arises due to the facts that (a) women in Ireland marry at a later age and (b) married women in Ireland have on the average a larger number of children and so continue bearing children for a greater number of years. When attention is confined to legitimate first births, in order to eliminate the effect of factor (b), the difference remains very pronounced (as may be seen from the Report for the year 1955 in this series).

The percentage distribution of births according to the number of previous children in 1955 and 1956 is shown in Table VII and a comparison made with the corresponding distributions in England and Wales and Scotland. The correspondence is not exact since the England and Wales figures relate to legitimate maternities to women married only once, while the figures for Scotland refer to all legitimate births and to previous live or stillborn children. The Irish figures include illegitimate births whereas if these had been excluded the contrast with England and Wales and Scotland would have been still more pronounced.

* Exclusive of the Six Counties

The difference between the years 1955 and 1956 in respect of the percentage distribution according to number of previous children was very slight. The percentage of women with large families was considerably higher in Ireland than in England and Wales or Scotland. Thus, in Ireland in 1955 19.0 per cent of the mothers had 5 to 9 previous children, the corresponding percentages being only 3.9 in England and Wales and 5.7 in Scotland.

In TABLE 35 legitimate births are classified by age of mother at maternity and duration of marriage, while in TABLE 37 a similar classification is done in respect of legitimate first births. The results contained in TABLE 37 are summarised in Table VIII.

TABLE VIII

It will be seen that only about 1 per cent of first births occurred at durations of marriage of over 10 years, and only 10 per cent occurred at durations of over 3 years. Over thirty-five per cent of first births (excluding cases with age not stated) were to mothers in the age group 25-29 years, while almost 11 per cent were to mothers aged 35 years or over.

Multiple Births

The number of infants born alive in multiple births registered in 1956 was 1,890, consisting of 936 pairs of twins and 6 sets of triplets.

DEATHS

The number of deaths registered during the year 1956 was 33,910 of which 18,269 were those of males and 15,641 those of females. This is equivalent to a rate of 11·7 deaths per 1,000 total population, compared with 12·6 in the previous year and 12·1 in 1954. The death rate of 11·7 per 1,000 population is the lowest so far recorded in this country.

In Table IX are shown the average annual death rates, by age group, for decennial periods since the beginning of this century, and for single years from 1951 to 1956.

While the crude death rate per 1,000 population has shown a gradual downward trend since the beginning of the century, striking falls have occurred in the death rates at the younger ages, and the improvement has been greatest in the most recent years. In the age groups above 65 years little change has occurred in the death rates since the period 1901-1910.

Table X compares the death rates in the years 1951-56 with those in the Six Counties, England and Wales and Scotland. In general the death rate in this country is somewhat higher than that in the neighbouring countries, but in 1956 the death rate in Ireland was below that for Scotland and equal to the rate in England and Wales.

Comparison between Counties

A difficulty arises when comparisons are made between the death rates in different regions of the country, due to the fact that the age distribution of the population varies considerably from one county to another. Thus, if a particular county contains a large proportion of elderly persons the crude death rate per 1,000 population will be relatively high even if the health conditions in that county are better

than the general average. To overcome this difficulty standardised death rates are prepared, as follows :— For each county the death rate in each age group is calculated by dividing the deaths of persons whose normal residence was in that county in each age group by the corresponding population. By multiplying the death rate in each age group by the total population in the whole country in that age group and summing the resulting products, an estimate is obtained of the number of deaths to be expected in the whole country, if the rates in the county under investigation applied generally. This “ expected number ” of deaths is divided by the total population of the country to give the county standardised death rate.

Table XI shows the crude and standardised death rates for each county and county borough in 1956.

STANDARDISED DEATH RATES (PER 1,000 POPULATION)
FROM ALL CAUSES 1956.

In certain areas the standardised rates differ appreciably from the crude rates. Leinster, which had the lowest crude death rate among the provinces in 1956, had the highest standardised rate. The standardised death rates in 1956 were lowest in the counties of Roscommon, Galway, Kerry and Mayo and highest in the County Boroughs of Cork, Limerick, Waterford and Dublin, the Borough of Dun Laoghaire and the County of Cavan.

The standardised death rate for each county is illustrated in Diagram 2.

Causes of Death

The tables in this Report showing cause of death are based on the Sixth Revision of the International Statistical Classification of Diseases, Injuries and Causes of Death, 1948, prepared by the World Health Organisation. The Sixth Revision was used for the first time in classifying death by causes in the 1950 Report. From 1940 to 1949 the Fifth Revision was used.

Table XII shows the deaths and death rates in 1956 from some of the principal groups of causes and the average numbers and rates for these causes in the periods 1935-37, 1945-47, 1950-52 and 1953-55.

The death rate from tuberculosis (all forms) in 1956 was less than one-fifth of its level in the periods 1935-37 and 1945-47. Deaths from cancer show a gradual but steady increase in number, and represented 13.5 per cent of all deaths registered in 1956, compared with 8.4 per cent in 1935-37. The death rate from vascular lesions affecting the central nervous system has shown an increase of almost 60 per cent from 1935-37 to 1956. A substantial increase in the death rate from diseases of the heart took place between 1935-37 and 1945-47, but since then practically no change has occurred. Other diseases of the circulatory system have, however, accounted for a steadily increasing number of deaths, the death rate from these causes in 1956 being more than double its level in 1935-37. The number of deaths due to influenza shows considerable variation from year to year, while the number of deaths from other diseases of the respiratory system has declined fairly steadily being, in 1956, less than half the figure in 1935-37. In each period a large number of deaths were stated to be due simply to senility, although a considerable reduction in this number has occurred over the twenty year interval (6,176 in 1935-37 compared with 2,627 in 1956). This reduction is largely explained by an increasing accuracy of certification of cause of death as well as a falling proportion of deaths which are not medically certified. The question of medical certification is discussed in a later section, but it will be realized that the accuracy of the comparisons made in this table is appreciably reduced by the fact that many of the deaths are not medically certified.

Deaths registered in 1956, classified by sex, age group and cause are shown in Table 19 of this Report, the Detailed International List of Causes of Death being used. In Table XIII the principal causes of death in each age group are examined.

Diseases of the heart caused the largest proportion of all deaths, namely 301 in every 1,000 deaths. Next in order were malignant neoplasms (134), vascular lesions affecting the central nervous system (107) and senility without psychosis (77). At ages under one year congenital malformations, birth injuries and diseases peculiar to early infancy accounted for 714 out of every 1,000 deaths. At ages one to 4 years, pneumonia was the principal cause of death, accounting for 215 per 1,000 deaths at these ages, while accidents, etc., caused 144 deaths and tuberculosis (all forms) 71 deaths. The proportion of deaths caused by tuberculosis increases considerably in the young adult age groups. At ages 15-24 years, 90 out of every 1,000 deaths were caused by this disease, while at ages 25-34 years the proportion of deaths due to tuberculosis rose to 154 per 1,000 deaths. At ages 35-44 years tuberculosis was still one of the major causes of death, accounting for 117 per 1,000 deaths at these ages. The principal causes of death at ages 35-44 years were malignant neoplasms (206 per 1,000 deaths) and diseases of the heart (168 per 1,000 deaths). Between the ages of 45 and 74 years diseases of the heart, malignant neoplasms and vascular lesions affecting the central nervous system were the principal causes of death.

Some of the principal causes of death are considered in greater detail in the following sections.

Tuberculosis

Table XIV shows the number of deaths and the death rate per 1,000 population for each of the years 1951 to 1956.

In 1956 there were 689 deaths from tuberculosis of which 562 were caused by the respiratory form and 127 by other forms of the disease. There has been a marked reduction in the number of deaths, both from tuberculosis of the respiratory system and other forms, in a comparatively recent period; the number of deaths in 1956 was the lowest recorded, showing a fall of 67 per cent since 1951. The trend in the death rate from tuberculosis (all forms) since 1938 is shown in Diagram 3.

In Table XV tuberculosis death rates are examined, by age groups, for a number of different periods.

INFANT AND NEO-NATAL MORTALITY (PER 1000 LIVE BIRTHS) 1938-1956

There was little change, either in the overall death rate or in the rates for individual age groups between the periods 1935-37 and 1945-47. By 1950-52, however, the death rates in the younger age groups were roughly halved, while in the most recent years the death rates for these age groups were only a fraction of their level in 1945-47. Thus, between 1945-47 and 1956 the death rate in the age group under 15 years was reduced by 88 per cent, in the group 15 to 19 years by 96 per cent and in the group 20 to 24 years by 96 per cent. In the group 55 years and over the reduction in the death rate was less marked, amounting to 43 per cent.

The death rates from tuberculosis in the years 1951 to 1956 in this country are compared with those in the Six Counties, England and Wales and Scotland in Table XVI.

Throughout the period the death rate from tuberculosis has been higher in Ireland than in the neighbouring countries. The striking feature of this table, however, is the extent to which Ireland, in which mortality from tuberculosis has for many years been heavier than in other countries, has shared in the general improvement.

The mortality from tuberculosis in the counties and county boroughs in 1956 is compared in Table 12 on page 15 of this Report. The highest death rates per 1,000 population from tuberculosis (all forms) were in Limerick County Borough (0.41), Laois (0.38), Dun Laoghaire Borough (0.32), and Clare (0.32), while the lowest rates were in Monaghan (0.10), Roscommon (0.11), Kilkenny (0.11), and Leitrim (0.13).

Cancer

Up to 1949 cancer deaths were those classified as Nos. 045 to 055 of the Fifth Revision of the International List of Causes of Death, while since the year 1950 deaths have been classified according to the Sixth Revision of the International List. It has been recommended by the World Health Organisation that total cancer deaths should be based upon Nos. 140 to 205 of the International Statistical Classification, 1948, but that for comparability with years prior to 1950 Nos. 140 to 205, excluding Nos. 201 (Hodgkin's disease) and 204 (Leukaemia and aleukaemia) should also be shown.

In 1956 there were 4,570 deaths from cancer (Nos. 140 to 205). Of this number, 40 deaths were caused by Hodgkin's disease and 123 by leukaemia and aleukaemia.

Table XVII shows the death rate from cancer in certain age groups in the years 1951 to 1956.

At the older ages some reduction in the mortality rate from cancer occurred in 1956 compared with 1955. This is in contrast to the trend in the previous five years in which the cancer death rate in the age groups 75 years and over showed a fairly steady rise. The death rate from cancer among males is appreciably higher than among females; in 1956 the male death rate for all ages was 17 per cent above that for females. Between the ages of 35 and 54 years the cancer death rates for males are slightly below those for females but at other ages, particularly above 75 years, the excess of male deaths is very marked. The trend in the death rate from cancer since 1938 is shown in Diagram 3; for the reason given earlier, the figures plotted in this diagram exclude deaths from Hodgkin's disease and leukaemia and aleukaemia.

The death rates from cancer in Ireland and neighbouring countries in the years 1951 to 1956 are compared in Table XVIII.

The general upward trend in the cancer death rate in each area will be noted. With the exception of the years 1954 and 1955 the cancer death rate in this country was slightly below that in the Six Counties. The cancer death rates in England and Wales and in Scotland were considerably higher than the rates in Ireland.

The death rates from cancer in 1956 in counties and county boroughs are compared in Table XIX. Standardised rates, which eliminate the effect of different age distributions in the different areas are also shown.

The crude death rate from cancer in 1956 varied from 2.12 per 1,000 population in Cork County Borough to 1.15 in County Carlow. In certain areas, however, the standardised rates were considerably different from the crude rates and when comparing the relative seriousness of mortality in different counties it is, of course, the standardised rates which should be used. In the counties of the west and north-west standardisation had the effect of lowering the death rates considerably. The standardised rates varied from 2.32 per 1,000 population in Cork County Borough to 1.12 in Leitrim. The proportion of deaths not medically certified varies widely between the different areas, being very high (i.e., 20-30 per cent) in the counties of Donegal, Roscommon, Mayo and Leitrim and low (i.e., less than 2 per cent) in the County Boroughs. Thus the possibility that some cancer deaths in the areas with low medical certification may escape detection should be borne in mind in comparing the death rates between counties.

Full details of deaths due to cancer registered in 1956, classified by site of the disease, and age group are contained in Table 19. The number of deaths and death rate from cancer per 100,000 in each age group for the main groups of sites are shown in Table XX and it will be observed that there is in general a rapid rise in the death rate with increasing age. Deaths due to malignant neoplasms of the Digestive system represented half the total cancer deaths for each sex, the death rate being about 24 per cent higher for males than females. The death rate from malignant neoplasms of the respiratory system was almost four times as great for males as for females. In the case of malignant neoplasms of the breast and genito-urinary organs the female death rate was more than double that of males, being high even in the younger age groups.

Diseases of the circulatory system

There were 12,373 deaths ascribed to diseases of the circulatory system (Nos. 400-468) registered in 1956, of which 6,746 were deaths of males and 5,627 deaths of females. Details of these deaths, classified by cause and age may be obtained from TABLE 19 of this Report while the numbers assigned to each county or county borough are shown in TABLE 21. Deaths and death rates from certain groups of causes are given in Table XXI.

The excess of male over female deaths in the case of diseases of the circulatory system is largely accounted for by the greater number of deaths of males from coronary and arteriosclerotic heart disease (2,055 males compared with 1,088 females); in respect of the remaining groups of causes the differences between the male and female death rates is not nearly so pronounced. In interpreting Table XXI it should be borne in mind that a number of deaths (mainly of elderly persons) stated to be due to heart diseases are not medically certified. The numbers of uncertified deaths in the above groups are shown in Table XXII.

TABLE XXII

DEATHS FROM DISEASES OF THE CIRCULATORY SYSTEM REGISTERED IN 1956 SHOWING THE NUMBERS AND PERCENTAGES NOT MEDICALLY CERTIFIED

Cause of death	Males			Females

Hypertension without mention of heart	269	5	1.9	259	8	3.1
Other diseases of circulatory system	514	9	1.8	425	3	0.7

It appears that only in the case of "Other diseases of the heart" are errors due to the incorrect assignment of uncertified deaths to the above groups likely to be substantial. A more serious source of error is the large number of uncertified deaths ascribed simply to "senility". Thus out of a total of 2,627 deaths (1,217 male, 1,410 female) stated to be due to senility, 1,482 (665 male, 817 female) were not medically certified. Of these uncertified deaths it is fair to suppose that a substantial proportion were caused by heart diseases.

Respiratory Diseases

Deaths from respiratory diseases (Nos. 470-527 on the International List) in 1956 numbered 2,654. These include 401 deaths caused by influenza, 961 by pneumonia, 938 by bronchitis and 354 due to other respiratory diseases.

Pregnancy, Childbirth and Puerperium

The number of deaths in this group in 1956 was 52, compared with 70 in 1955. The death rate was 0.86 per thousand births.

Infant Mortality

During the year 1956 the deaths of 2,162 infants under one year of age were registered, compared with 2,264 in the previous year and 2,364 in 1954. The figure for 1956 is equivalent to a rate of 35.6 per 1,000 live births registered, this being the lowest ever recorded and compares with 36.7 in 1955 and 37.8 in 1954. Table XXIII shows the mortality rates, per 1,000 births, at different ages under one year, for the years 1938 and 1946 to 1956.

* For 1950 to 1956 under 4 weeks.

Infant mortality showed little change from 1938 to 1947, but since then a considerable reduction has occurred. The greatest improvement has been in respect of mortality of infants over one month : deaths between the ages of one month and one year declined from 39·1 per 1,000 births in 1947 to 12·9 per 1,000 births in 1956. The reduction in neo-natal mortality (i.e., at ages under one month) has been less marked : whereas deaths under one month amounted to 28·8 per 1,000 births in 1947, the corresponding figure in 1956 was 22·7. No significant reduction has occurred since 1947 (or 1938) in mortality at ages under 24 hours or between one day and one week. Deaths occurring within 24 hours of birth represented 7·0 per 1,000 births in 1947, compared with 7·4 in 1956. Deaths occurring between one day and one week after birth represented 8·8 per 1,000 births in 1947 compared with 8·2 in 1956. The trends in the infant and neo-natal mortality rates since 1938 are illustrated in Diagram 4.

In Table XXIV the infant mortality rates in Ireland and neighbouring countries are compared for the years 1951 to 1956.

* Exclusive of the Six Counties

In each of the years shown the infant mortality rate in this country was the highest in the table while that in England and Wales was the lowest. Up to the year 1930 the infant mortality rate in Ireland had maintained a lower level than that in the Six Counties, England and Wales and Scotland. In the decade 1931-40 also the Irish rate compared very favourably with those in the Six Counties and Scotland, although a marked reduction in infant mortality in England and Wales had brought the rate for these countries below that for Ireland. The subsequent decrease in infant mortality has been greater in the Six Counties, England and Wales and Scotland than in this country.

Table XXV compares the neo-natal and infant mortality rates in the year 1956 for counties and county boroughs.

NOTE :—In some cases the figures in the first two columns do not tot to that in the third column on account of rounding.

In 1956 the infant mortality rates were highest in the Counties of Laois, Mayo, Limerick, Tipperary (S.R.), Kildare and Kilkenny. The lowest rates of infant mortality occurred in Waterford County Borough, the Counties of Leitrim, Offaly, Sligo and in Dun Laoghaire Borough. The neo-natal mortality rate ranged from 9 per 1,000 births for Waterford County Borough to 32 per 1,000 births for Counties Laois and Clare.

The causes of deaths of infants under one year, classified according to the Detailed International List are shown in TABLE 19. In Table 25 infant deaths are again classified by cause, and a more detailed age classification shown. These results are summarised in Table XXVI.

	Other causes	17	16	34	118	185
	Total	453	498	429	782	2,162

It will be seen that the relative importance of the various groups of causes differs appreciably between deaths at ages under one week and deaths at ages one month to one year. At ages under one week 30 per cent of all deaths were ascribed to immaturity, while, as may be seen from TABLE 25, many deaths ascribed to other underlying causes were with mention of immaturity. Postnatal asphyxia and atelectasis accounted for 19 per cent of deaths under one week, birth injuries for 16 per cent, and congenital malformations for 16 per cent. Six per cent of the deaths under one week were assigned to the heading "Ill-defined diseases peculiar to early infancy" (No. 773 of the Detailed International List); deaths described by such terms as "asthenia", "athrepsia", "cachexia", "debility", "inanition", "marasmus", "cyanosis neonatorum", "hepatitis of newborn", or "sclerema neonatorum", and not otherwise specified must be allocated to this heading. The majority of deaths due to haemolytic or haemorrhagic disease were at ages under one week. At ages over one month, congenital malformations were still an important cause of death, but only a small proportion of deaths were ascribed to immaturity, birth injuries or asphyxia. The majority of infant deaths from tuberculosis, meningitis, respiratory diseases, gastro-enteritis, and convulsions occurred at ages over one month. Details of the 185 deaths ascribed to "other causes" may be obtained from TABLE 19. This figure includes 53 deaths from external causes (accidents, etc.), 6 from septicaemia and pyaemia, 6 from measles, 5 from meningococcal infections and 8 from diseases of the thymus gland.

Accidents, poisoning and violence

The number of deaths from external causes (Nos. E.800-999) registered in 1956 was 1,016, of which 715 were those of males and 301 those of females. The excess of male mortality from these causes was very marked at all ages between 5 and 75 years. In the age groups between 10 and 45 years, in which male deaths from all causes outnumbered female deaths, it will be seen from TABLE 19 that the excess of male deaths was due to the higher number of deaths from accidents. Table XXVII shows the number of deaths from accidents, poisoning or violence in 1956 and certain previous years.

The number of deaths caused by road vehicle accidents increased steadily each year, the figure for 1956 being the highest recorded. The number of deaths from drowning was lower than in 1955. Statistics of road accidents (fatal and non-fatal) are compiled by the Garda Síochána each year and issued to the press and other interested parties. A summary of the principal results is published in the March issue of the Irish Trade Journal and Statistical Bulletin. Slight discrepancies between the numbers of deaths, as ascertained from the two sources are due mainly to the fact that whereas the Garda figures relate to year of occurrence the figures in this Report relate to year of registration.

Particulars of deaths registered in 1956 due to accidents in the home are given in Table XXVIII.

It will be seen that accidental falls resulted in 47 deaths of which the majority were deaths of elderly persons. Accidents caused by fire, hot liquids, etc., resulted in 33 deaths of which 16 were of children under 15 years and 12 were of persons aged 65 years and over.

Uncertified Deaths

The number of cases in 1956 in which the cause of death was not certified by a medical practitioner was 2,622, which represents 7.7 per cent of the total deaths registered. In Table 23 uncertified deaths registered in 1956 are shown classified by county and age group, while the percentage of deaths uncertified in each county is also shown. The proportion of deaths uncertified is very high in the west and north-west regions of the country, being highest, in the year 1956, in the counties of Leitrim (23.1 per cent), Mayo (21.7 per cent) and Donegal (19.0 per cent).

Table XXIX compares the percentages of deaths uncertified in each province for a number of years, and it will be observed that a steady improvement in the position is taking place.

Actual number of deaths uncertified ...	2,622	54	7	5	2	7	15	42	95	331	2,064

The proportion of deaths uncertified was highest in the age groups 65-74 years and 75 years and over, while only a very small proportion of young adult deaths was uncertified. In most age groups the provinces of Connacht and Ulster (part of) compare very unfavourably with Leinster and Munster in respect of the percentage of deaths uncertified.

Inquests and post-mortems

The number of deaths registered on certificates issued by Coroners as the result of inquests and post-mortem examinations during 1956 was 1,696 compared with 1,884 in 1955 and 1,553 in 1954.
